

The variable are sex and age around 75 to 84 who are living in different areas of Philadelphia. The spatial distribution of the variable is clustered. On the far northeast of Philadelphia has the highest variable values and the southwest Philadelphia contain the lowest variable values. Potential reasons for why the variable has that spatial pattern is the distribution of prosperous and traffic. Near the center city areas, there are more business stores, schools and young people. And these areas are not very good for old people to live and the consuming level is higher. Therefore, compared to the center city, northeast Philadelphia is more suitable for old people's living.
