

# Week 5: The Beer Game and the Bullwhip Effect

## MIS 3537: Internet & Supply Chains

Prof. Edward (Ed) Beaver

# The rules: On the Clock

## Last Week (Intro)

- I gave you as much time as you need
- Proceed to next week when all orders have been placed

## This Week (Round 1)

- There will be a timer (upper right of screen)
- If counter is zero without your input, system will reuse previous decision

Let's play the game!

# Break Time

**Start Recording**

# Your thoughts

- Which role are you playing?
- How are you Feeling?

# Your thoughts

- What were your individual costs? What was the total supply chain cost?
- What could have helped you bring down the costs?

# Learning Objectives

- Have some fun with the beer game
- Understand the “bullwhip effect”
- Learn what causes the effect
- Learn ways to counteract the bullwhip

# The “Pampers” problem

- Pampers – a P&G products
- Mild fluctuations in retail sales; excessive fluctuations at distributor level
- The orders of materials to the Pampers’ suppliers, e.g.: 3M, fluctuated even more
- Yet, Pampers were “consumed” at the same steady rate
- What explains the variability?

# At Hewlett-Packard

- Similar problem at HP – major printer manufacturer

# Fluctuations at HP

- Some fluctuations at retailer level are understandable
- More fluctuations at reseller level
- Much greater fluctuations in manufacturing division's orders to the Integrated Circuit division

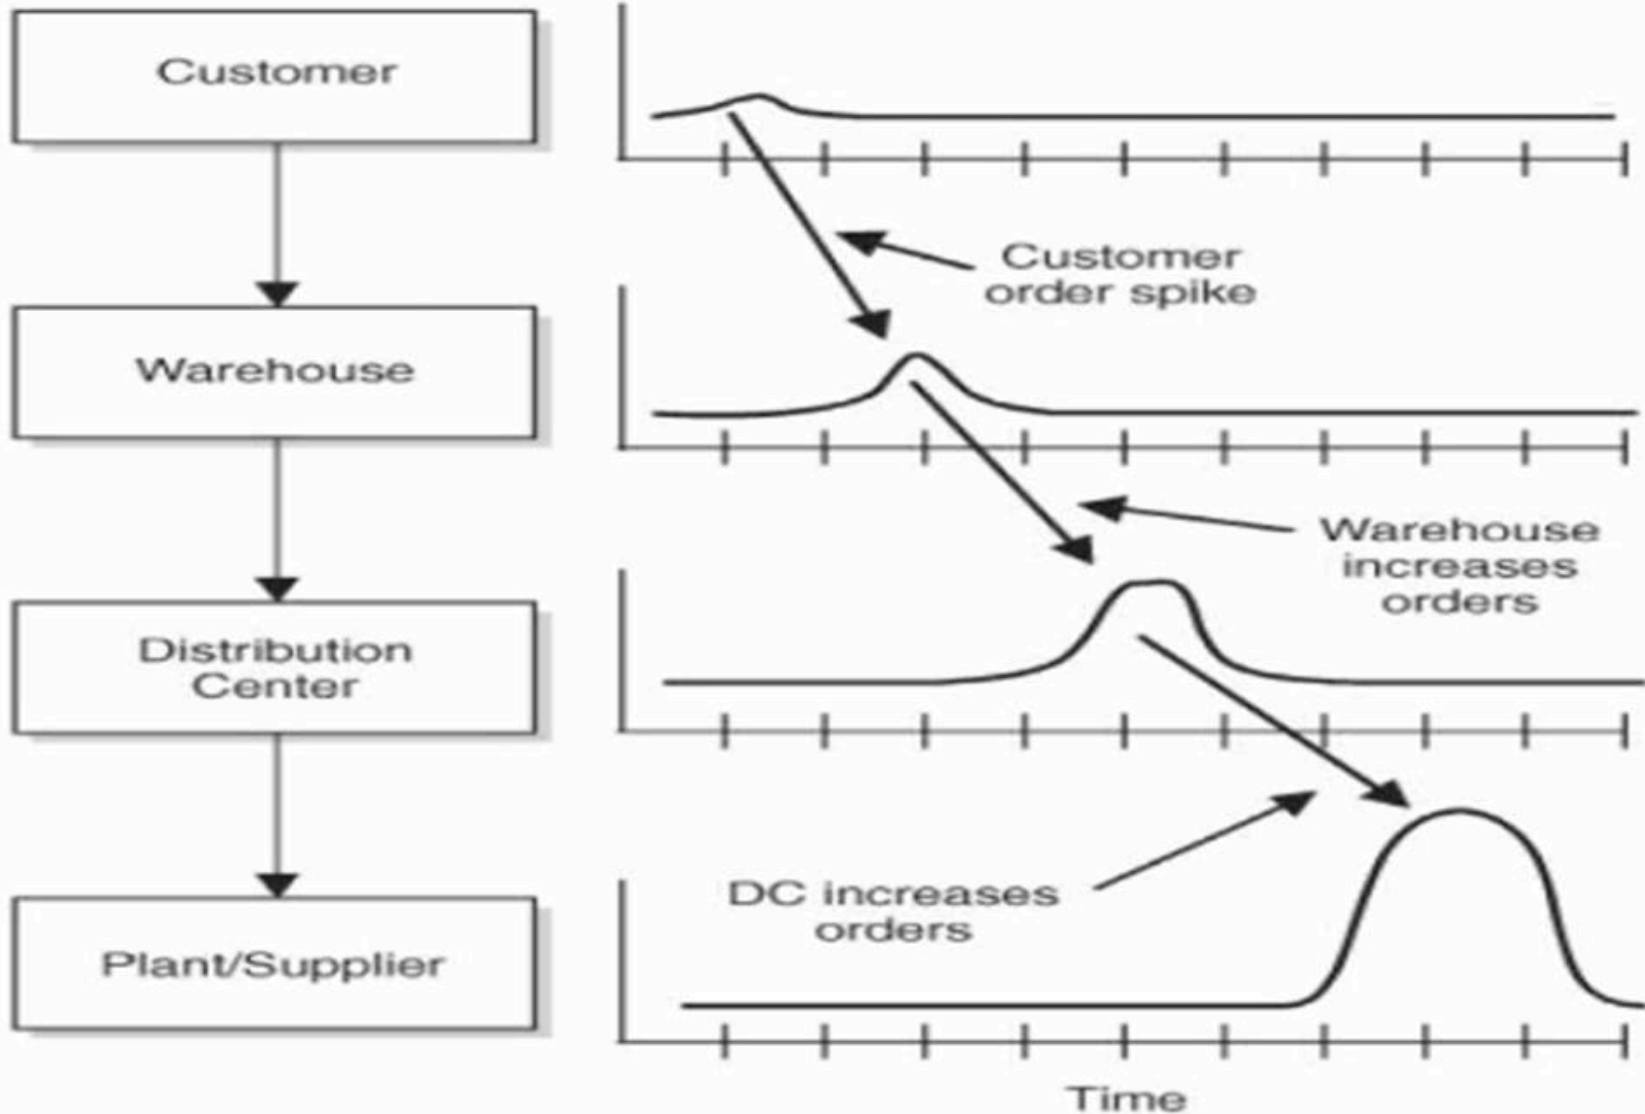

# Fluctuations along the chain

Figure 1 Increasing Variability of Orders up the Supply Chain

# Fluctuations along the chain

# Fluctuations along the chain

- Consumer sales are relatively stable
- The retailer's orders show more variability
- The wholesaler's orders show even more variability
- The manufacturer's orders show much greater fluctuations

# The bullwhip effect

- Distorted information from one end of the supply chain to another creates a fluctuation in how the various entities behave
- The resulting variability in forecasts, orders and inventory levels is called the “bullwhip effect”

# Learning Objectives

- Have some fun with the beer game
- Understand the “bullwhip effect”
- Learn what causes the effect and
- Learn ways to counteract the bullwhip

# What causes the bullwhip effect?

- Demand forecast updating

- Order batching

- Price fluctuation

- Rationing and shortage gaming

# Demand forecast updating

- Forecasts are generally made using the exponential smoothing technique
- At each level in the supply chain, the input to the demand forecast is the orders from one level below in the supply chain (esp. when level is different company, organization)
- As orders from the level below keep changing, so does your forecast
- Your forecast is the input to the forecast of the entity one level above
- As your forecasts vary, their forecasts vary even more

# Demand forecast updating

## Mobile-phone supply chain example

- 1 Retailer anticipates selling 100,000 handsets a month—requires 100,000 in stock and 300,000 on order from manufacturer.
- 2 Consumer demand drops 5%.
- 3 Retailer has 20,000 excess phones—5,000 unanticipated phones left over in stores at the end of the month, as well as 15,000 too many arriving in the next 3 months.
- 4 Retailer reduces next month's order by 20%.
- 5 The demand signal is further magnified as it moves upstream.

# Counteract: Avoid multiple demand order forecasts

- What causes multiple demand order forecasts?
  - Forecast from one entity becomes input for higher-level entity
  - Simply put, different entities in the supply chain work with different demand data
- To counteract
  - Share data
  - Create demand forecasts using same raw data

# Avoid multiple forecasts (contd.)

- Tools & techniques
  - Use point-of-sale data
    - The actual sale data becomes the raw data for forecast updates along the system
  - Electronic Data Interchange / Internet
    - EDI or Internet web services ensures that the same data is shared across multiple entities at frequent intervals
  - Computer-assisted ordering

# Order batching

- A retailer orders products in batches
- When demand comes in, the retailer does not order immediately, but accumulates demand and then orders again in batches
- This causes a constant ebb and flow

# Counteract: Break order batches

- Orders involve paperwork and red tape
- Also companies offer differential pricing between full-truckload and less-than-truckload transportation
- How to counteract?
  - EDI
  - Truckloads with different products (Mixed Loads)

# Price fluctuation

- On average, 80% of transactions in the grocery industry is “forward buy”
- Forward buying results in price fluctuations
- Also, there are price discounts, quantity discounts, coupons, rebates etc
- Hence customers buy in quantities that doesn't reflect immediate needs
- How often have you bought an extra box of corn flakes or an extra bottle of juice because of a temporary price reduction?

# Counteract: Stabilize prices

- Problem
  - Forward buying leads to price fluctuations
  - Price discounting leads to uneven demand patterns
- How to counteract?
  - Reduce frequency and level of wholesale price discounting
  - Everyday Low Price / Value pricing strategy

# Rationing and Shortage Gaming

- Scenario: Demand exceeds supply
  - Manufacturer can ration product supply
  - If total supply is only 50% of total demand, customers will receive only 50% of their order
  - Knowing this, customers exaggerate their real needs when they order
  - When demand cools, orders get cancelled

Examples: Sales of DRAM chips in the 1980s; disappearance of HP Laserjet orders

Rationing means  
a fair share for all of us

# Counteract: Eliminate shortage gaming

- Problem
  - Demand exceeds supply
  - Suppliers order more to counteract lower supply
- How to counteract?
  - Do not allocate products on basis of orders alone
  - Allocate in proportion to past sales records

# Eliminate shortage gaming (contd.)

- Information sharing
  - “Shortage gaming” arises due to lack of trust
  - Sharing information can help overcome this
- Stop generous return policies!
  - Penalties for returns to manufacturers; this ensures that retailers will not exaggerate needs, and later cancel orders

# Summary

| Causes of Bullwhip            | Information Sharing  | Channel Alignment   | Operational Efficiency   |
|-------------------------------|--|---|--|
| <b>Demand Forecast Update</b> | <ul style="list-style-type: none"> <li>• Understanding system dynamics</li> <li>• Use point-of-sale (POS) data</li> <li>• Electronic data interchange (EDI)</li> <li>• Internet</li> <li>• Computer-assisted ordering (CAO)</li> </ul> | <ul style="list-style-type: none"> <li>• Vendor-managed inventory (VMI)</li> <li>• Discount for information sharing</li> <li>• Consumer direct</li> </ul>                         | <ul style="list-style-type: none"> <li>• Lead-time reduction</li> <li>• Echelon-based inventory control</li> </ul>                   |
| <b>Order Batching</b>         | <ul style="list-style-type: none"> <li>• EDI</li> <li>• Internet ordering</li> </ul>   | <ul style="list-style-type: none"> <li>• Discount for truck-load assortment</li> <li>• Delivery appointments</li> <li>• Consolidation</li> <li>• Logistics outsourcing</li> </ul> | <ul style="list-style-type: none"> <li>• Reduction in fixed cost of ordering by EDI or electronic commerce</li> <li>• CAO</li> </ul> |
| <b>Price Fluctuations</b>     |  | <ul style="list-style-type: none"> <li>• Continuous replenishment program (CRP)</li> <li>• Everyday low cost (EDLC)</li> </ul>  | <ul style="list-style-type: none"> <li>• Everyday low price (EDLP)</li> <li>• Activity-based costing (ABC)</li> </ul>                |
| <b>Shortage Gaming</b>        | <ul style="list-style-type: none"> <li>• Sharing sales, capacity, and inventory data</li> </ul>  | <ul style="list-style-type: none"> <li>• Allocation based on past sales</li> </ul>  |  |

# Root Beer Game Completion Schedule

- Practice session (completed in class) – *February 4*
- Complete Round 1 – in class *February 11*
- Team decision (via e-mail to professor) on Round 2 change – *by February 18*
- Game reset and ready to start Round 2 – *February 20 (see blog post)*
- Complete Round 2 and Submit deliverables – *by March 10*

What's  
the  
plan?

# Root Beer Game: Round 2 Options

Each Team Can make 1 of the following changes for Round 2

- A. Point of Sale (POS) information available to all Roles (not just retailer)
- B. Shipping Delay reduced to 1 week from 2
- C. Information Delay (Order) reduced to 1 week from 2

What's  
the  
plan?

# Root Beer Game: Note

- The demand pattern may change between the different rounds.
- The intent of playing multiple rounds is to demonstrate how manipulating certain aspects of the game can influence the performance of the supply chain.
- Here are the **deliverables** of the beer game (one submission per group):

- . Complete the performance spreadsheet of our group ([click here](#))

- . Prepare a short writeup on  how you played

What's  
the  
plan?

# Root Beer Game: Deliverables

## One submission per group

1. Complete the performance spreadsheet of your group (link in blog)
2. Short write-up: How you played the beer game. What strategies you employed and how they changed when you played the beer game the second time compared to the first. e.g.
  - What was your strategy in the game for placing orders placing and holding inventory? How did this strategy change for Round 2?
  - How was the communication and cooperation between various players in the group? How did it change from Round 1 to 2?
  - What lessons from the beer game would you give to supply chain managers?

What's  
the  
plan?

# Next week...

- Exam I
  - Study Guide and sample test posted soon
- RFID Lecture
