Summary

LEARNING OBJECTIVES

- ✓ Explain the role of conceptual data modeling in the overall analysis and design of an information system.
- ✓ Describe the information gathering process for conceptual data modeling.
- ✓ Describe how to represent an entity-relationship model and be able to define the terms: *entity type*, *attribute*, *multivalued attribute*, and *relationship*.
- ✓ Distinguish among unary, binary, and ternary relationships as well as associative entities, providing an example of each.
- ✓ Define supertypes and subtypes, showing how to represent these entity types with ER diagramming notation.
- ✓ Define four basic types of business rules in a conceptual data model.
- ✓ Explain the role of prepackaged database models (patterns) in data modeling.

Models

Summary

CONCEPTUAL DATA MODELING

Conceptual data modeling: a detailed model that captures the overall structure of data in an organization

- Independent of any database management system (DBMS) or other implementation considerations

CONCEPTUAL DATA MODELING (CONT.)

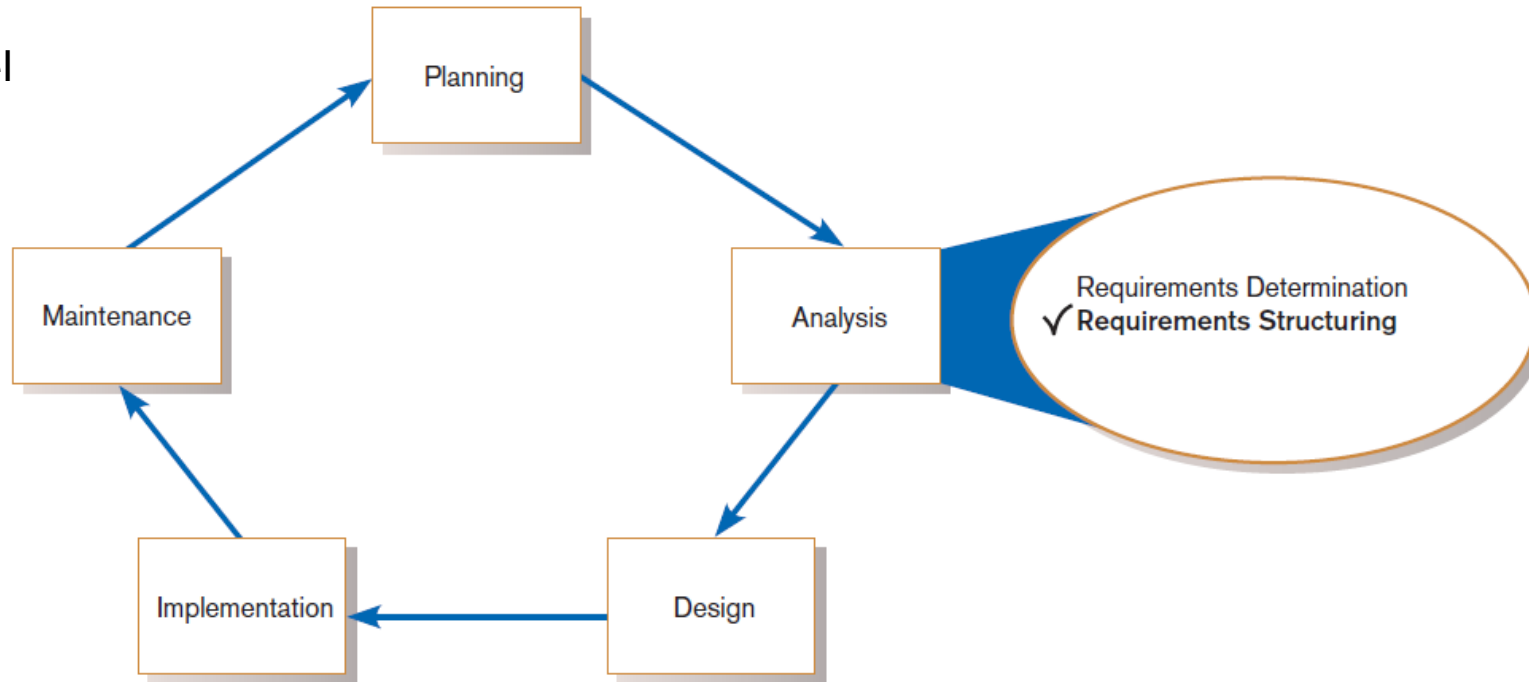

FIGURE 8-1

Systems development life cycle with analysis phase highlighted

Introduction

**Conceptual Data
Modeling**

THE CONCEPTUAL DATA MODELING PROCESS

Gathering Information

Develop a data model for the current system.

Intro to the E-R Model

Develop (or purchase) a new conceptual data model that includes all requirements of the new system.

Modeling with E-R

In the design stage, the conceptual data model is translated into a physical design.

Super/Sub Types

Business Rules

Project repository links all design and data modeling steps performed during SDLC.

Packaged Data
Models

Summary

Introduction

Conceptual Data Modeling

DELIVERABLES AND OUTCOME

Gathering Information

Entity-relationship (E-R) diagram or UML class diagram

Intro to the E-R Model

- Entities (or classes) – categories of data, represented as rectangles
- Relationships (or associations) – lines between the entities

Modeling with E-R

Set of entries about data objects to be stored in repository project dictionary, or data modeling software

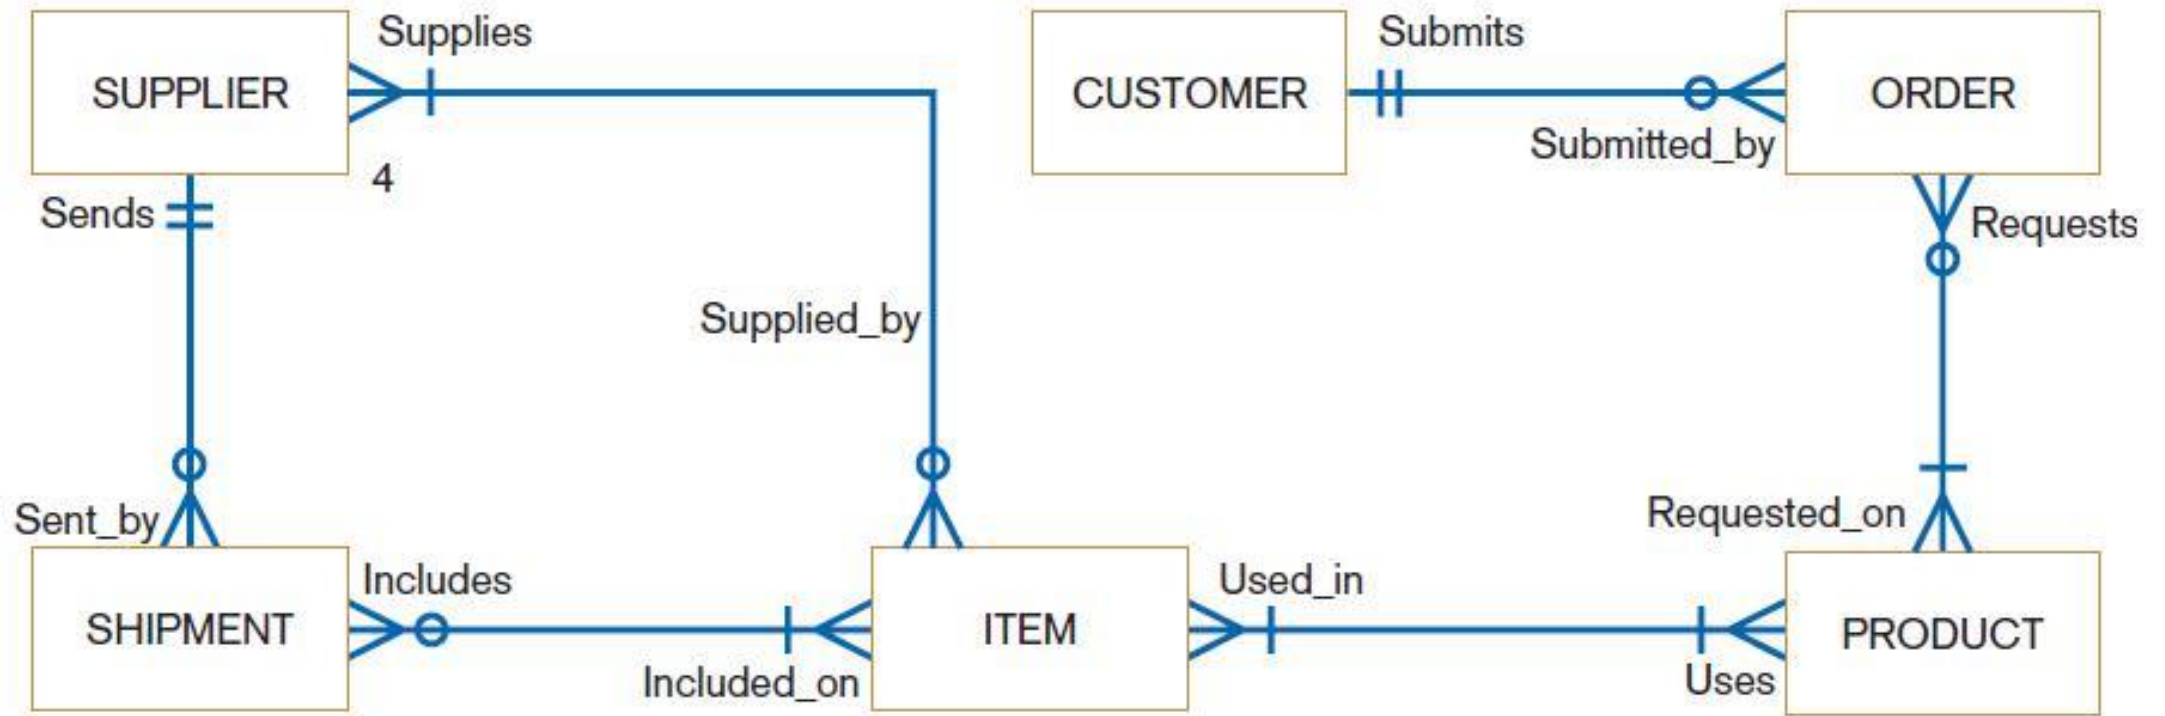

Super/Sub Types

- Repository links data, process, and logic models of an information system.
- Data elements included in the data flow diagram (DFD) must appear in the data model and vice versa.
- Each data store in a process model must relate to business objects represented in the data model.

GATHERING INFORMATION FOR CONCEPTUAL DATA MODELING

Introduction

Conceptual Data Modeling

Gathering Information

Intro to the E-R Model

Modeling with E-R

Super/Sub Types

Business Rules

Packaged Data Models

Summary

Two perspectives on data modeling:

- *Top-down approach* for a data model is derived from an intimate understanding of the business.
- *Bottom-up approach* for a data model is derived by reviewing specifications and business documents.

Introduction

NAMING AND DEFINING ENTITY TYPES

An entity type name should be:

- *A singular noun.*
- *Descriptive and specific to the organization.*
- *Concise.*

Event entity type should be named for the result of the event, not the activity or process of the event.

Introduction

Summary

NAMING AND DEFINING ENTITY TYPES (CONT.)

An entity type definition:

- Includes a statement of *what the unique characteristic(s) is (are) for each instance.*
- Makes clear *what entity instances are included and not included in the entity type.*
- Often includes a description of *when an instance of the entity type is created or deleted.*

Models

Summary

CARDINALITIES IN RELATIONSHIPS

Cardinality: the number of instances of entity B that can (or must) be associated with each instance of entity A

Minimum Cardinality

- The minimum number of instances of entity B that may be associated with each instance of entity A

Maximum Cardinality

- The maximum number of instances of entity B that may be associated with each instance of entity A

Summary

REPRESENTING SUPERTYPES AND SUBTYPES (CONT.)

Business Rules for Supertype/subtype Relationships:

- **Total specialization** specifies that each entity instance of the supertype must be a member of some subtype in the relationship.
- **Partial specialization** specifies that an entity instance of the supertype does not have to belong to any subtype, and may or may not be an instance of one of the subtypes.

Introduction

Models

Summary

BUSINESS RULES (CONT.)

Four basic types of business rules are:

- **Entity integrity:** unique, non-null identifiers
- **Referential integrity constraints:** rules governing relationships between entity types
- **Domains:** constraints on valid values for attributes
- **Triggering operations:** other business rules that protect the validity of attribute values

Business Rules

Packaged Data
Models

Summary

TRIGGERING OPERATIONS

Includes the following components:

- **User rule:** statement of the business rule to be enforced by the trigger
- **Event:** data manipulation operation that initiates the operation
- **Entity Name:** name of entity being accessed or modified
- **Condition:** condition that causes the operation to be triggered
- **Action:** action taken when the operation is triggered

ROLE OF PACKAGED CONCEPTUAL DATA MODELS — DATABASE PATTERNS

Introduction

Conceptual Data Modeling

Gathering Information

Intro to the E-R Model

Modeling with E-R

Super/Sub Types

Business Rules

Packaged Data Models

Summary

Packaged data models provide generic models that can be customized for a particular organization's business rules.

Universal data models are templates for

- one or more core subject areas such as:
 - Customers, products, accounts, documents
- and/or core business functions such as:
 - Purchasing, accounting, receiving, etc.

**Packaged Data
Models**

Summary

ROLE OF PACKAGED CONCEPTUAL DATA MODELS — DATABASE PATTERNS (CONT.)

Industry-specific data models are designed to be used by organizations within specific industries.

These models are based on the premise that data model patterns for organizations are similar within a particular industry.

BENEFITS OF DATABASE PATTERNS AND PACKAGED DATA MODELS

Introduction

Conceptual Data Modeling

Gathering Information

Intro to the E-R Model

Modeling with E-R

Super/Sub Types

Business Rules

Packaged Data Models

Summary

Dramatically reduced implementation times and costs

- Provides a starting point for asking requirements questions

Higher-quality models

- Represent “best practice” data modeling techniques and data model components whose quality often exceeds that which can be achieved by internal development teams, given typical organizational pressures

SUMMARY

In this unit you learned how to:

- ✓ Explain the role of conceptual data modeling in the overall analysis and design of an information system.
- ✓ Describe the information gathering process for conceptual data modeling.
- ✓ Describe how to represent an entity-relationship model and be able to define the terms: *entity type*, *attribute*, *multivalued attribute*, and *relationship*.
- ✓ Distinguish among unary, binary, and ternary relationships as well as associative entities, providing an example of each.
- ✓ Define supertypes and subtypes, showing how to represent these entity types with ER diagramming notation.
- ✓ Define four basic types of business rules in a conceptual data model.
- ✓ Explain the role of prepackaged database models (patterns) in data modeling.
