

Our company has an opportunity to generate additional revenue by investing in Smart-Toilet. Smart-Toilet would run on DNA testing technology and would provide immediate analysis of stool and urine samples. The revenue would be generated from patients and Insurance companies.

Smart-Toilet would be a Wi-Fi enabled device that would trace the stool and urine sample and draw a complete analysis of the patient's health condition. It will monitor nutrient, mineral and salts -intake along with Fats, Proteins and Carbohydrates. The water level in the Smart-Toilet would be automatically maintained in conjunction with margin of error from the final yield of the sample. Patients will be registered using name, age, sex and DNA. The analysis for the specific Patient would be recorded on Amazon's separate database called Kindle-Medical and would be accessible to the patient, medical Institutions and Insurance companies.

This technology would create a significant revenue stream from the Health-care field. This technology would allow insurance companies to set insurance rates according to the up-to-date medical condition of a patient. The revenue will not be limited to the sale of the equipment, but we can also charge a monthly maintenance and data protection fee. Investing in this technology would revolutionize the health-care system.
