

By investing in Microsoft SharePoint our company will increase its total benefits by \$700,000 annually. Currently, we are only billing out 75% of the total work hours per year with our current systems. SharePoint allows our PMPs to work more efficiently and increase the amount of hours we bill out by 20%. Investing in SharePoint will allow our company to work more efficiently and dramatically decrease our backload of work.

Integrating the SharePoint web application platform allows our company to utilize collaborative efforts with creating, sharing, and managing any projects we have at any given time. SharePoint's platform integrates many Microsoft programs such as Outlook and Project, making this application easily managed by employees and keeping our workplace better organized. Having SharePoint gives us a better handle on our existing backload of work by creating a single location to organize all of the company's content, ideas, and projects that need to be managed by multiple personnel. This means that content can be worked on by multiple personnel simultaneously in real time. Each PMP will bill out an additional 400 hours per year generating more revenue through the use of this platform. SharePoint has the ability to bring our company to the next level by improving upon our productivity and gaining the efficiency that this web application can provide us.

With an investment of \$151,250 to SharePoint, our company will save over \$2.1 million over the next three years. By utilizing SharePoint our company will have a net benefit of \$1.8 million in the next three years. The overall benefits of SharePoint outweigh the financial cost of implementing and operating this new platform into our company.
