ROADMAP

START

Week 1: Introduction & Systems Analysis

- Course Description
- Systems Thinking

Week 1: Introduction to Process Mapping

- Systems & Processes
- Swim Lane Diagrams
- Assignments due::
- Course video intro
- Max Labs Pre-Flight
- Proctorio Practice Quiz

Week 2: Data Modeling & ERD

- Max Labs 1A/1B- due
- Max Labs 2A/2B due

Week 2:

Exam #1

1/29 – 1/31: Exam Availability

Week 4 :

Exam #2

2/12-2/14 Exam Availability

Week 4: Cybersecurity & AI

- Protection Protocols
- Artificial Intelligence
- Lean IT #2 due
- Cyber Security due

Week 4: Platforms & Digital Business Models

- API's
- Cloud

Week 3: Information Systems

- ERP & CRM
- Data Analytics & SCM
- Max Labs 3a/3b due
- Lean IT #1 due

Week 5: JavaScript Unit #1 & 2

- Hello World,
- Variables
- Operator types
- Strings

SoloLearn Coding due

Week 6: JavaScript Unit #3&4

- Logical Operators
- Conditional Types
- Intro to Loops
- While and Do
- Coding Challenges *3) due
- Proctorio Coding Practice due

Week 7: HTML & CSS

- Coding Assignment -due

Week 7:

Exam #3

3/5 – 3/7: Exam Availability

HTML is all about displaying content. CSS is all about making content look good. JavaScript adds the interactivity.

You need all three to create nifty looking sites.

Without interactivity, so much of the internet just won't work. **This interactivity is provided by JavaScript.**

What exactly is a program?

[illegible]

Source: <https://lh3.googleusercontent.com/ZcDhYaffPS-f2HBoYXUwT5Zm9F6VwHdGxwMw7G4HsG6GF7o3H8ToGjynKLosbP2EQ=s114>

JavaScript (commonly shortened to just **JS**) is a programming language made up of English-looking words arranged in a particular way to tell your browser to do something.

All JavaScript and no HTML or CSS

HelloWorld2.html from
previous coding challenge

```
26
27   var name = prompt("What is your name? ");
28
29   if (name != "") {
30       alert('Hello ' + name);
31   }
32   else {
33       alert('Hello stranger');
34   }
35
36
37
```

All JavaScript and no HTML or CSS

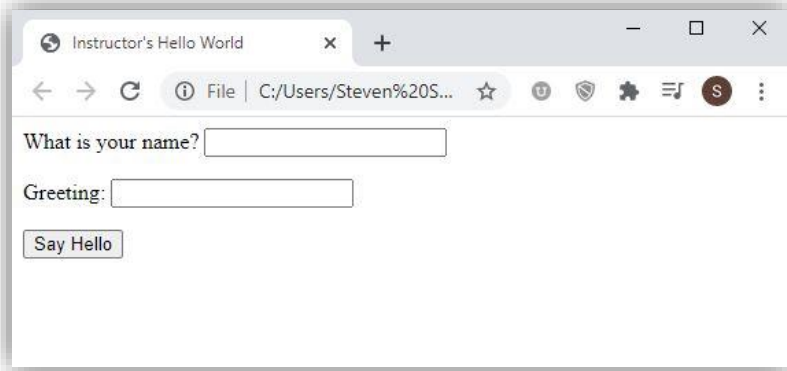

That is the program we
worked on last week

```
1  <!DOCTYPE html>
2  <html>
3  <body>
4  <script>
5
6  function numberOfGuessesMade() {
7
8      var randomNumber = Math.floor(Math.random() * 100) + 1;
9      var numberOfGuesses = 1;
10
11     guess = parseInt(prompt('Guess a number between 1 and 100: '));
12
13     while (guess !== randomNumber) {
14
15         if (guess < randomNumber) {
16             alert('Your guess was too low');
17         }
18
19         if (guess > randomNumber) {
20             alert('Your guess was too high');
21         }
22
23         numberOfGuesses = numberOfGuesses + 1;
24         guess = parseInt(prompt('Guess a number between 1 and 100: '));
25     }
26
27     return numberOfGuesses;
28 }
29
30
31
32 alert('It took ' + numberOfGuessesMade() + ' guesses to guess the random number.');
```

JavaScript is “Event Driven”, that is, interactive. It waits for the user to do something and then executes code.

But how does your code get access to the information typed on the form?

JavaScript with a Little HTML

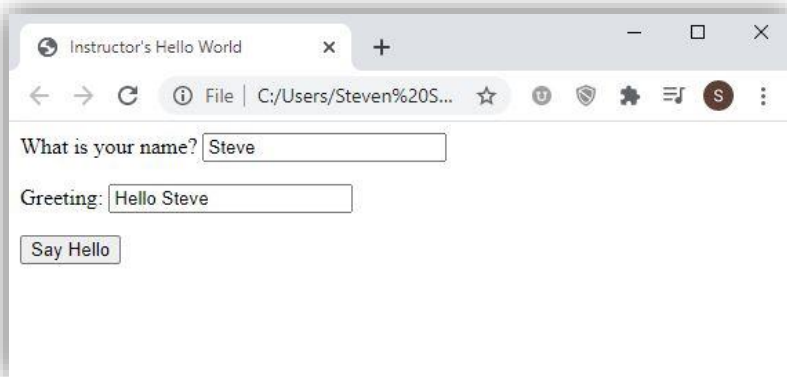

Instructor's Hello World

What is your name?

Greeting:

Say Hello

Instructor's Hello World

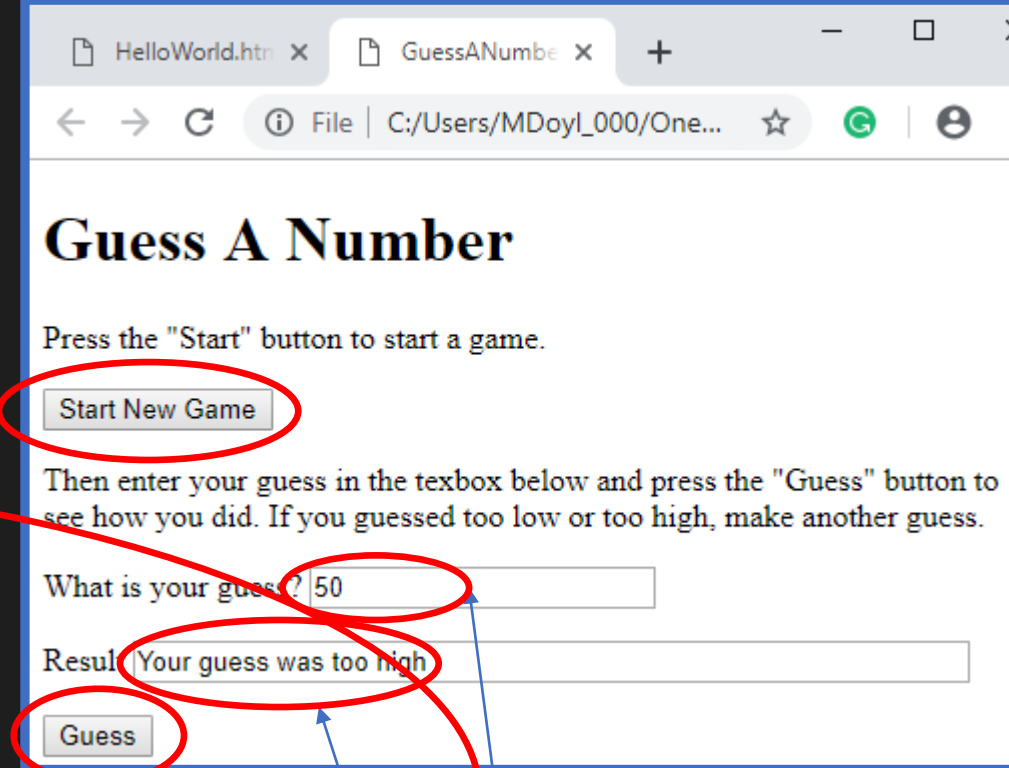

What is your name? Steve

Greeting: Hello Steve

Say Hello

```
_Week 14 Discussion > <> HelloWorld - week 14 ppt example.html > html
1  <!DOCTYPE html>
2  <html>
3  <body>
4
5      <title> Instructor's Hello World</title>
6  <script>
7
8      function sayHello() {
9
10         var name = document.getElementById("input").value;
11
12         if (name != ""){
13             document.getElementById("hellofield").value = 'Hello ' + name;
14         } else {
15             document.getElementById("hellofield").value = 'Hello stranger';
16         }
17     }
18
19 </script>
20 What is your name? <input type="text" id="input"> <P>

Guess A Number

Press the "Start" button to start a game.

Start New Game

Then enter your guess in the textbox below and press the "Guess" button to see how you did. If you guessed too low or too high, make another guess.

What is your guess?

Result

Guess

Time for “Challenges”!

Challenges – (week 14 coding files)

- **Unit 1 – Profits (ICA #9)**
- **Unit 1 – TotalPurchases**
- **Unit 2 – SalesTax**
- **Unit 2 – MaleAndFemalePercentages**
- **Unit 3 – RomanNumerals**
- **Unit 3 – MagicDates**
- **Unit 4 – PenniesForPay**

Diamond Peer Teacher Jack Granieri

[Profits HTML Coding Walkthrough](#)

FOX
MIS

Profits

Open up the profits program (week 14 coding files). Add your function / HTML. If time permits try adding a style tag to define the fonts, color for the header and paragraph tags.

These make the tags. You should be accustomed to it by now.

```
1 <!DOCTYPE html>
```

```
2 <html>
```

```
3 <body>
```

```
4 <script>
```

```
5
6 function calculate_profits(){
7   var totalSales = document.getElementById("sales").value;
8   var profits = totalSales * .23;
9   document.getElementById("profits").value = profits;
10  }
```

```
11
12 </script>
```

```
13 <h1> Welcome to the Profits Program </h1>
```

```
14 <p>What are your projected total sales? <input type="text" id="sales"></p>
```

```
15 <p>Profits are <input type="text" id="profits"></p>
```

```
16 <p><input type="button" id="calculate" VALUE="CALCULATE" onclick=calculate_profits()></p>
```

```
17 </body>
```

```
18 </html>
```

Notice how this is different than we did in previous challenges. Here we use header `<h1>` and paragraph `<p>` tags to display the text. The input tags define what type of the value is present on the page. Id refers to the specific element on the page.

Our function which gets the sales from the text box and then calculates the profits. Then it assigns the textbox for profit with the value of profits we calculated.

ICA9 : HTML & CSS (last one!)

Profits

4-5 students per break out room for 30 minutes

Diamond Peer Teacher Patrick Jurgelewicz

[Total Purchases HTML Coding Walkthrough](#)

FOX
MIS

Total Purchases

Open up the TotalPurchases challenge, instead of using prompts try using textboxes to get the input and display the data using textboxes after the user clicks the button.

The code: TotalPurchases

```
1  <!DOCTYPE html>
2  <html>
3  <body>
4  <script>
5
6  function total_purchases(){
7  var item1Price = document.getElementById("item1").value;
8  item1Price = parseFloat(item1Price);
9  var item2Price = document.getElementById("item2").value;
10 item2Price = parseFloat(item2Price);
11 var item3Price = document.getElementById("item3").value;
12 item3Price = parseFloat(item3Price);
13 var item4Price = document.getElementById("item4").value;
14 item4Price = parseFloat(item4Price);
15 var item5Price = document.getElementById("item5").value;
16 item5Price = parseFloat(item5Price);
17
18 var subTotal = item1Price + item2Price + item3Price + item4Price + item5Price;
19 document.getElementById("subtotal").value = subTotal;
20 var salesTax = subTotal * .07;
21 document.getElementById("salestax").value = salesTax;
22 var total = subTotal + salesTax;
23 document.getElementById("total").value = total;
24
25 }
26 </script>
27
28 <h1> Welcome to the Profits Program </h1>
29 <p>What is the price of item 1? <input type="text" id="item1"></p>
30 <p>What is the price of item 2? <input type="text" id="item2"></p>
31 <p>What is the price of item 3? <input type="text" id="item3"></p>
32 <p>What is the price of item 4? <input type="text" id="item4"></p>
33 <p>What is the price of item 5? <input type="text" id="item5"></p>
34 <p>-----</p>
35 <p>The subtotal of the order is $ <input type="text" id="subtotal"></p>
36 <p>The sales tax (7%) is $ <input type="text" id="salestax"></p>
37 <p>The total of the order is $ <input type="text" id="total"></p>
38 <p><input type="button" id="calculate" VALUE="CALCULATE" onclick=total_purchases()></p>
39 </body>
40 </html>
41 </body>
42 </html>
```

This is where our function goes, here we get the data from the five text boxes with the prices, store them in variables, convert them to decimals.

Calculate subtotal by adding them up, assign the element for subtotal with the value of subtotal.

Calculate the sales tax using subtotal, assign the element for sales tax with the value of sales tax.

Calculate total with the addition of sales tax and subtotal, assign the element for total with the value of variable total.

After script tag, make header and paragraph tags for fonts on the webpage.

Make textboxes for getting prices of items

Then display the subtotal, sales tax, total in a textbox

Make a button to initiate the function.

Diamond Peer Teacher

Sean Boyer

[Sales Tax HTML Coding Walkthrough](#)

FOX
MIS

Sales tax

Open up the sales tax program and try to add the textboxes and buttons to it. Again, get the amount using textboxes and display the total with salestax.

```

1  <!DOCTYPE html>
2  <html>
3  <body>
4  <script>
5
6  function orderTotal() {
7    var subtotal = document.getElementById("amount").value;
8    subtotal = parseFloat(subtotal);
9    var stateSalesTax = subtotal * .05;
10   var countySalesTax = subtotal * .025;
11   var total = subtotal + stateSalesTax + countySalesTax;
12   document.getElementById("total").value = total;
13 }
14
15 </script>
16 <h1> Welcome to the Order Total Program </h1>
17 <p>What is the amount of the purchase? <input type="text" id="amount"></p>
18 <p>The total for the order including state and county sales tax is $ <input type="text" id="total"></p>
19 <p><input type="button" id="calculate" VALUE="CALCULATE" onclick=orderTotal()></p>
20
21 </body>
22 </html>

```

This function gets the subtotal from the textbox, parses it, then calculates the state sales tax, county sales tax, and total. It assigns the element for total with the value of variable total.

We create the header <h1> and paragraph <p> tags with some texts to make the program look more presentable. We'll also make a button to call the function to do the calculation and display the output.

Diamond Peer Teacher

Jack Granieri

[Male And Female Percentages HTML Coding Walkthrough](#)

FOX
MIS

Female and Male Percentages

Open up the MaleAndFemalePercentages program which asks user the number of females and males present, after that display the total number of people, percentage of females and percentage of males.

the code: female and male percentages

```
1 <!DOCTYPE html>
2 <html>
3 <body>
4 <script>
5
6 function calculatePercentage(){
7   var females = document.getElementById("females").value;
8   females = parseInt(females);
9   var males = document.getElementById("males").value;
10  males = parseInt(males);
11  var total = females + males;
12  document.getElementById("total").value = total;
13  var female_percentage = females/total * 100;
14  document.getElementById("female_percent").value = female_percentage;
15  var male_percentage = males/total * 100;
16  document.getElementById("male_percent").value = male_percentage;
17 }
```

```
18
19 </script>
```

```
20
21 <h1> Welcome to the Percentages Program </h1>
22 <p>How many females are in this class? <input type="text" id="females"></p>
23 <p>How many males are in this class? <input type="text" id="males"></p>
24 <p>Total is <input type="text" id="total"></p>
25 <p>Female Percentage is <input type="text" id="female_percent"> %</p>
26 <p>Male Percentage is <input type="text" id="male_percent"> %</p>
27 <p><input type="button" id="calculate" VALUE="CALCULATE" onclick=calculatePercentage()></p>
28 </body>
29 </html>
```

This function gets the count of females and males from the textbox, parses it, then calculates the total, percentage of females, and percentage of males. It assigns the element for total with the value of variable total. Similarly for female and male percentage.

Now in the body, we make textboxes to ask user number of females and males. Then we also make textboxes to display the data back to the user. The button here will invoke the function which will be responsible for all the calculations.

Exam 3: Opens Friday (3/5) at 6 PM
Close Sunday (3/7) at Midnight

Final Exam Review
