## MIS 4596

Data Privacy

Class 4

### Agenda

- Online privacy
- Privacy and data protection by design
  - Data provenance and data lineage
  - Data lineage metadata and its processing
  - Audit of SCE's enterprise information processing
  - Metadata processing enables data privacy by design
- Lab: Web Privacy and Anonymity

#### GDPR requires data security by design and default...

Data protection capabilities must work from beginning to end of data processing to enable protection of individuals' personal data by default

- ) Taking into account the state of the art, the cost of implementation and the nature, scope context and purposes of processing as well as the risks of varying likelihood and severity for rights and freedoms of natural persons posed by the processing, the controller shall, both at the time of the determination of the means for processing and at the time of the processing itself implement appropriate technical and organisational measures such as pseudonymisation, which are designed to implement data-protection principles, such as data minimisation, in an effective manner and to integrate the necessary safeguards into the processing in order to meet the requirements of this Regulation and protect the rights of data subjects
- (2) The controller shall implement appropriate technical and organisational measures for ensuring that, by default, only personal data which are necessary for each specific purpose of the processing are processed. That obligation applies to the amount of personal data collected, the extent of their processing, the period of their storage and their accessibility In particular, such measures shall ensure that by default personal data are not made accessible without the individual's intervention to an indefinite number of natural persons
- (3) An approved certification mechanism pursuant to Article 42 may be used as an element to demonstrate compliance with the requirements set out in paragraphs 1 and 2 of this Article

**Key General Data Protection Regulation (GDPR) requirements:** 

- **Collection** of personal data is **fully avoided or minimized** at the 1. earliest stage of processing
- Data subjects give **specific**, **informed** and **explicit** consent to the 2. processing of their data
- 3. Data subjects have **right to access, review and rectify** their personal data
- Data subjects have the **right to withdraw given consent** with 4. effect for the future and
  - Block access
  - Constrain processing and use
  - Erase their personal data
- Personal data obtained for one purpose must not be processed 5. for other purposes not compatible with the original purpose

Danezis, G. et al. (2014) "Privacy and Data Protection by Design", European Union Agency for Network and Information Security (ENISA)

D' Acquisto, G. et al. (2015) "Privacy by design in big data", European Union Agency for Network and Information Security (ENISA)

## Achieving "Privacy by Design" is difficult

Privacy is a complex, multifaceted and contextual notion Not the primary requirement of an information system May come into conflict with other requirements

"...privacy and data protection features are... ignored by traditional engineering approaches when implementing desired functionality.

• This ignorance is caused by limitations of awareness and understanding of developers and data controllers as well as lacking tools to realize privacy by design"

Danezis, G. et al. (2014) "Privacy and Data Protection by Design", European Union Agency for Network and Information Security (ENISA)

### Privacy and Data Protection by Design

"Although the concept has found its way into legislation as the... European General Data Protection Regulation, its concrete implementation remains un-clear at the present moment"

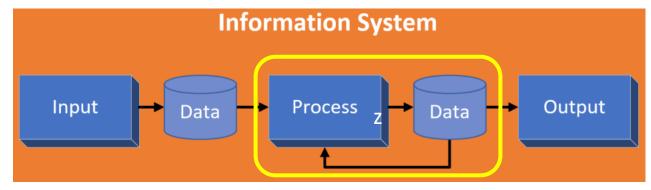

> Danezis, G. et al. (2014) "Privacy and Data Protection by Design", European Union Agency for Network and Information Security (ENISA)

# Some challenging data protection requirements may be solved with techniques presented in this webinar...

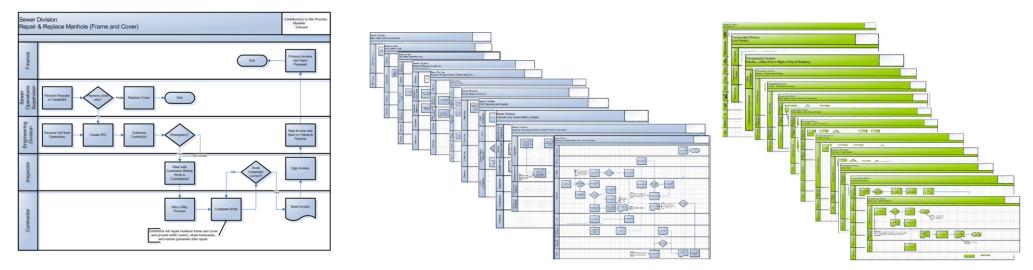

- **1. Collection** of personal data is **fully avoided or minimized** at the earliest stage of processing
- 2. Data subjects give <u>specific</u>, <u>informed</u> and <u>explicit</u> consent to the processing of their data
- 3. Data subjects have **right to access, review and rectify** their personal data
- 4. Data subjects have the **right to withdraw given consent** with effect for the future and
  - Block access
  - Constrain processing and use
  - Erase their personal data
- 5. Personal **data obtained for one purpose must not be processed for other purposes** not compatible with the original purpose

#### As a practical matter...

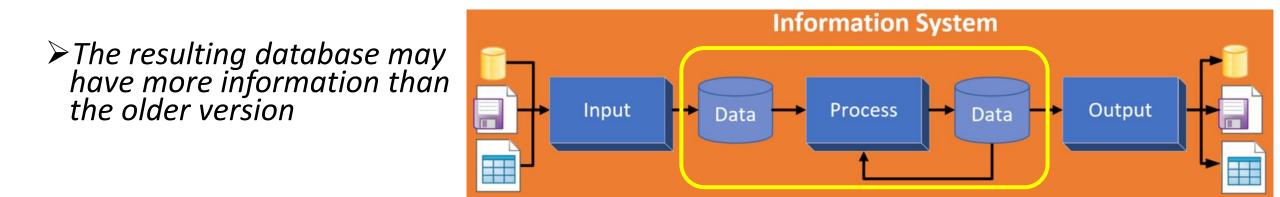

Data within information systems are often stored and organized as datasets within files and/or databases...

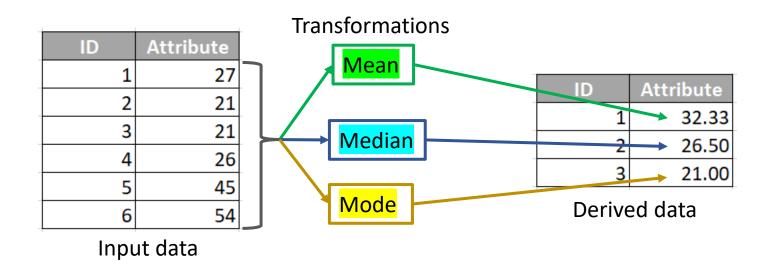

Regardless of application, there is reliance on data processing workflows to produce and use information

Data processing often transforms existing data into new data, which is a double-edged sword...

> The meaning of the new information, however, is exogenous and not found in the data itself

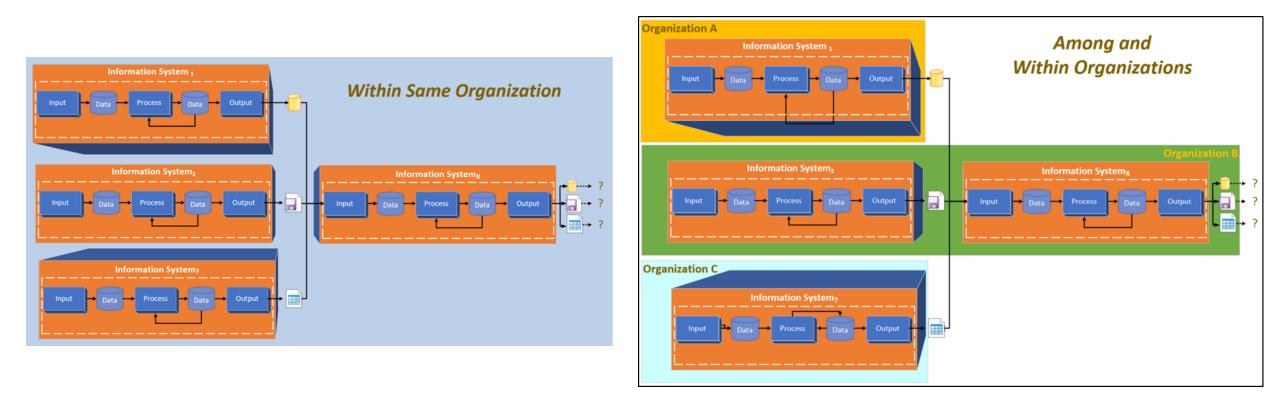

### Evaluating & judging data's "fitness for use"

- Is not the responsibility of the producer
- Is the responsibility of the user ...and IT Auditor

## Data produced for one purpose is often used to serve other purposes

Data producers should provide information about data that permit informed determinations of fitness for use

# Datasets are often exchanged without information needed to determine their fitness for use...

#### Provenance

*Provenance* traces back to 1294 in Old French as a derivative of the Latin *provenire* 

• To come from, to be due to, be the result of

In the art domain provenance entails an artifact's complete ownership history

#### **Traditional Provenance**

Durand-Ruel, Paris, August 23, 1872 [1]; Catholina Lambert, New Jersey; Lambert sale, American Art Association, Plaza Hotel, New York, NY, February 21, 1916 until February 24, 1916, no. 67; Durand-Ruel, Paris, until at least 1930; purchased by Simon Bauer, Paris, by June 1936 [2]; anonymous sale, Parke-Bernet Galleries, Inc., February 25, 1970, no. 19 [3]; Sam Salz, Inc., New York, NY; purchased by Museum, May 1971.

#### Notes:

[1] bought from the artist.
[2] Listed and illustrated in "List of Property Removed from France during the War 1939-1945" (no. 7114, as belonging to Simon Bauer).
[3] "Highly Important Impressionist, Post-Impressionist & Modern Paintings and Drawings", illustrated.

Standardizing Museum Provenance – David Newbury (@workergnome)

Newbury, D. (2017) "Standardizing Museum Provenance for the Twenty-First Century", from talk given at the Yale Center for British Art

There is an established research process for obtaining an artifact's trusted provenance

• The information is highly valued, particularly to authenticate real versus fraudulent works

"Provenance" is now increasingly used in a broad range of fields with various degrees of conflation of two closely related but distinct concepts of trust and metadata

Tullis, J.A. et al., 2016, "Geoprocessing, Workflows, and Provenance", in <u>Remote Sensing Handbook: Remotely Sensed Data Characterization, Classification, and Accuracies</u>, edited by P. Thenkabail, Vol. 1., pp. 401-422, Boca Raton, FL: CRC Press.

#### Provenance

W3C Provenance Incubator Group's definition of provenance (in a web resource context):

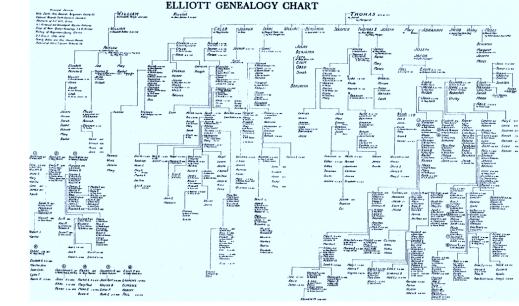

- Provenance is a record that describes entities and processes involved in producing and delivering or influencing a resource
- Provenance provides a critical foundation for assessing authenticity, enabling trust, and allowing reproducibility
- Provenance assertions are contextual metadata that can become important records with their own provenance

https://www.w3.org/TR/prov-primer/

## Provenance and data lineage

"Data provenance" and "data lineage" is used here interchangeably, overlooking subtle differences in their meanings

• Data provenance suggests process history

- Data lineage implies a kind of genealogy or data pedigree record relative to both
  - 1. Sources of data
  - 2. Processing applied to the sources to produce an information product

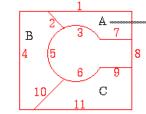

This presentation explores how data lineage metadata can aid understanding and establish trust of data

## Early metadata standards for documenting lineage of data produced with Geographic Information Systems

How can I program the computer to help me remember what I knew about the data I loaded and processed on my computer?

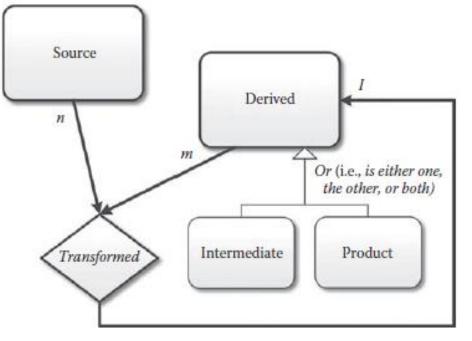

How do we understand differences among datasets created during processing applications?

## Data lineage vocabulary helps communicate how data is processed in an information system

#### and can aid thinking about how to meet privacy by design requirements

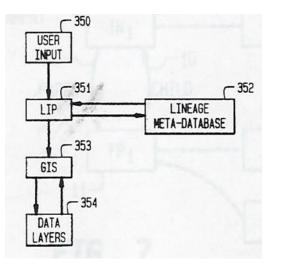

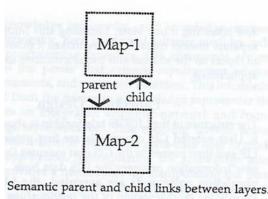

Source datasets may contain personal data

Derived datasets inherit this personal data from their input

- Using transformations such as:
  - Relational database joins and relates
  - Queries, arithmetic, statistical, spatial processing...

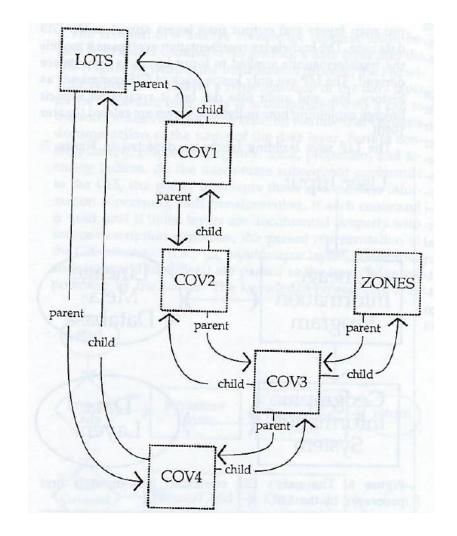

Semantic "parent" & "child" metadata links added to enable deductions about relationships among input & output datasets...

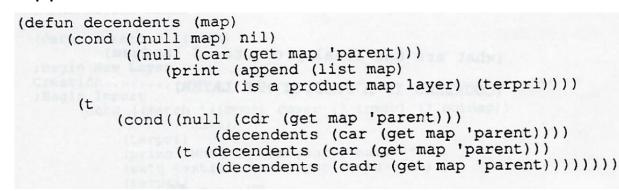

**Input datasets** provided with parent links pointing to output datasets can answer the question: *Who am I the parent of?* 

**Output datasets'** child links connect them back to their input datasets can answer the question: *Who am I the child of?* 

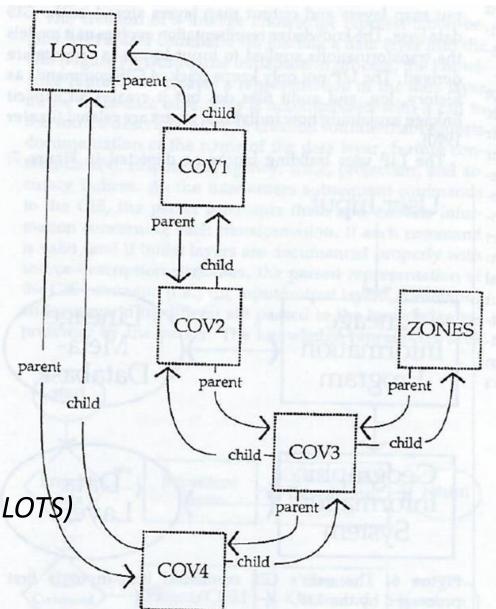

**Descendants** function traces parent links to identify all datasets derived from a source or other derived input dataset used within the application.

Descendants ("LOTS") = (COV1, COV2, COV3, COV4)

**Ancestors** function traces child links to identify input datasets used to create a derived dataset

Ancestors ("COV4") = (LOTS, COV3, ZONES, COV2, COV1, LOT\$)

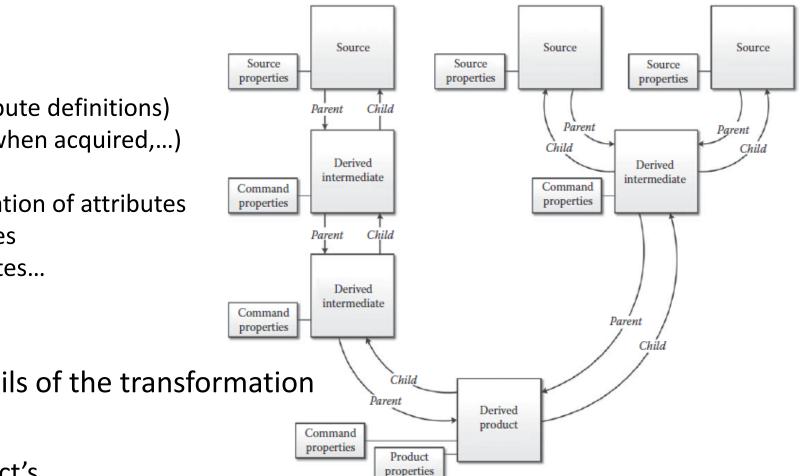

#### Source properties can include:

- Originating organization
- Data content (i.e. entity and attribute definitions)
- Timeliness (e.g. when collected, when acquired,...)
- Accuracy
- Confidentiality security categorization of attributes
  - Privacy sensitivity of attributes
- Integrity categorization of attributes...
- Availability categorization...

**Command properties** include details of the transformation

Product properties include the product's

- intended goal
- Users
- when published
- responsible manager,...

### Meet Geo\_lineus source metadata input

(geo\_lineus)I am Geo\_lineus Please give me information or ask questions: import cover landuse landuse

What is the source name? landuse-landcover

Containing what cartographic features? hydrography urban agriculture wetland

What is the source date? 3/12/75

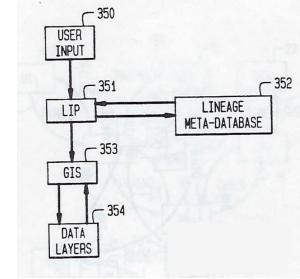

What is the source agency? USGS

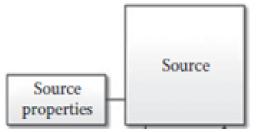

What is the source scale? 1/24000

What is the source projection? UTM

What is the source accuracy? +-80 meters

Thank You!

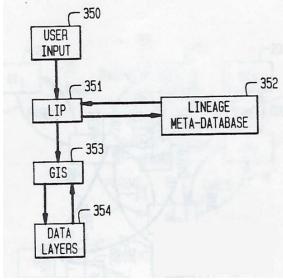

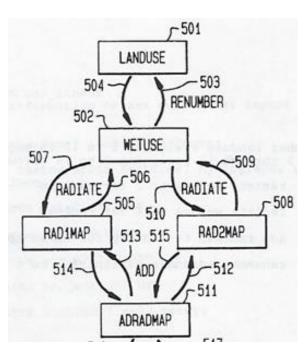

SOURCE DESC	RIPTION FRAME
SOURCE:	Digital line graph
FEATURES:	Hydrography
S_DATE:	4/7/83
AGENCY:	USGS
SCALE:	1:100,000
PROJECTION:	Mercator
ACCURACY:	+-10 meters Horiz

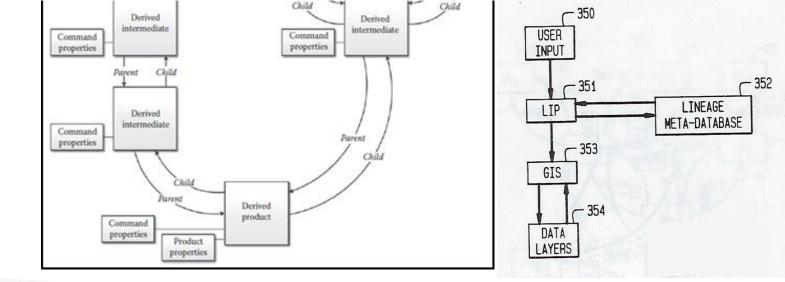

### Command metadata input...

(geo\_lineus) (I AM GEO\_LINEUS) (PLEASE GIVE ME INFORMATION OR ASK QUESTIONS) (renumber landuse assigning 1 to 2 through 13 assigning 0 to 1 through 11 assigning 0 to 14 through 18 for wetuse) (I UNDERSTAND) (radiate wetuse to 2 for rad1map) (I UNDERSTAND) (radiate wetuse to 6 for rad2map) (I UNDERSTAND) (add rad1map to rad2map for adradmap)

## Product Metadata input...

export cover adradmap1 eco zones

What is the product's name? eco\_zones

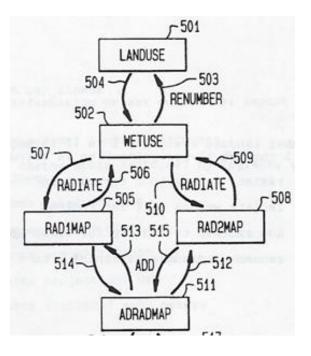

What is the product's use? Environmental protection of wetlands

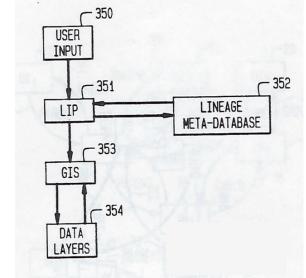

Who are the product's users? Dept of Health and Environ. Conservation

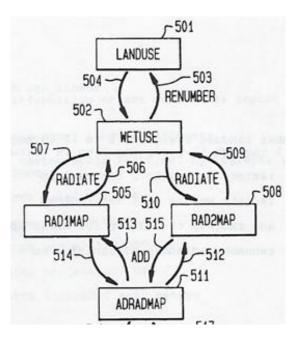

Who is responsible for the product? Diego Essinger

What is the product's release date? 3/5/89

Thank You!

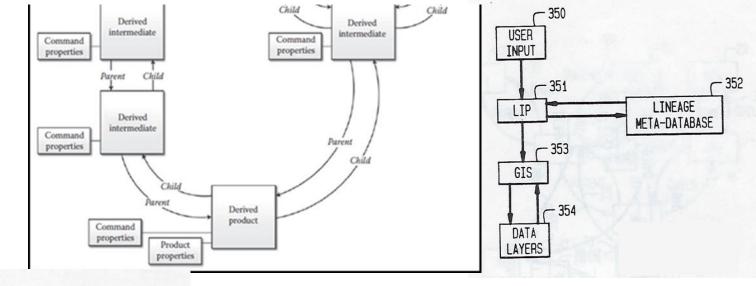

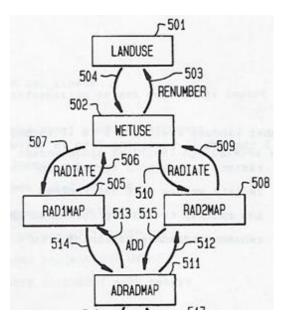

#### Querying metadata...

Is landuse a parent of adradmap (YES INDEED LANDUSE IS A PARENT OF ADRADMAP)

What is the lineage of adradmap1 (INPUT TO ADRADMAP1 IS ADRADMAP COMMAND IS RENUMBER) (INPUT TO ADRAPMAP IS RAD2MAP RAD1MAP COMMAND IS ADD) (INPUT TO RAD2MAP IS WETUSE COMMAND IS RADIATE) (INPUT TO WETUSE IS LANDUSE COMMAND IS RENUMBER) (LANDUSE IS AN ORIGINAL MAP LAYER) (INPUT TO RAD1MAP IS WETUSE COMMAND IS RADIATE) (INPUT TO WETUSE IS LANDUSE COMMAND IS RENUMBER) (LANDUSE IS AN ORIGINAL MAP LAYER)

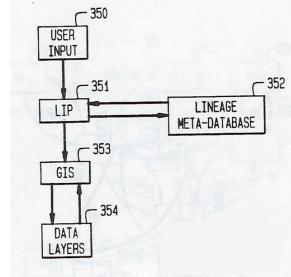

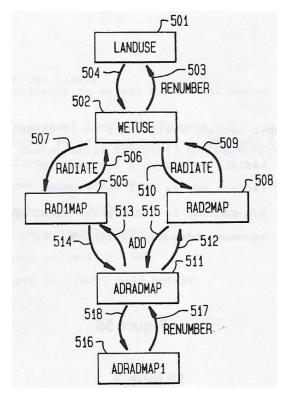

## Querying metadata...

What are the final products of landuse (ADRADMAP1 IS A PRODUCT MAP LAYER)

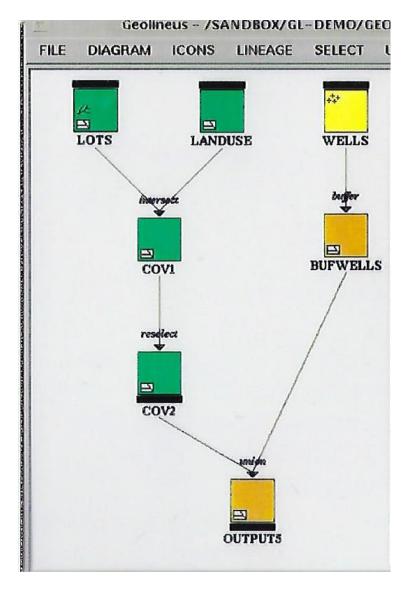

(BECAUSE RAD2MAP IS A PARENT OF ADRADMAP AND ADRADMAP IS A PARENT OF ADRADMAP1)

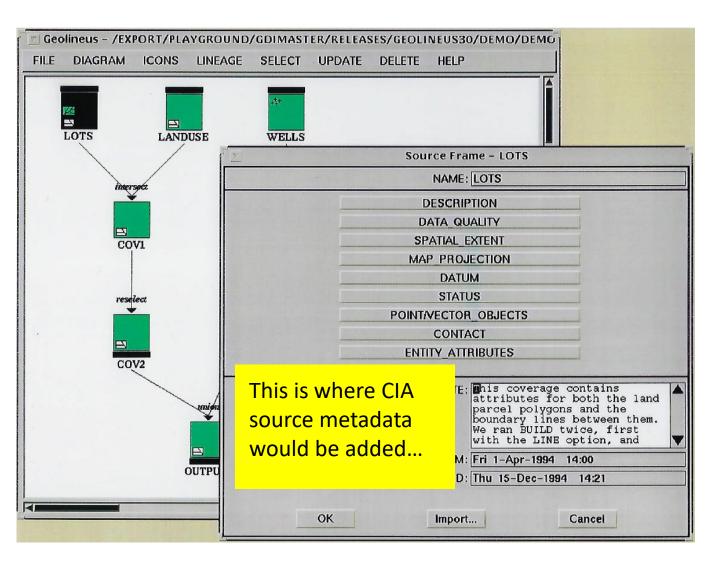

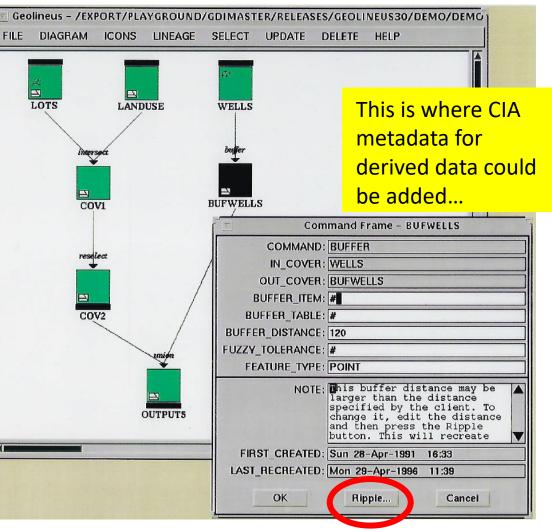

# Adding a graphical user interface...

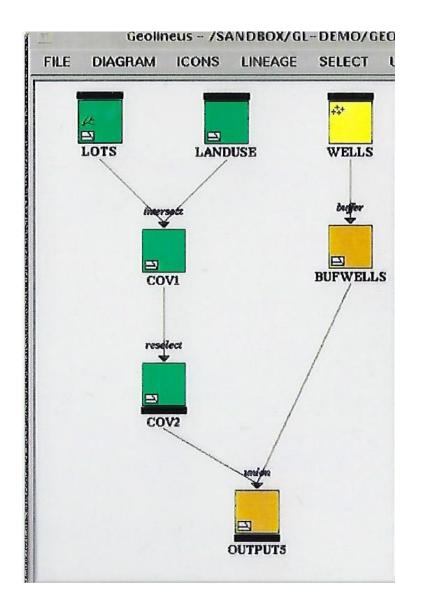

Help on icons GRID scalar variable. Source layer. A basic data layer in the GIS. Derived layer. Layer was created as a result of an ARC/INFO command like Coverage has been edited in ARCEDIT since the BUFFER, INTERSECT or GRIDPOLY. last CLEAN and BUILD. Æ Product layer. A derived layer that represents the final step in a GIS Coverage has been edited in ARCEDIT since the application. To turn a derived layer last CLEAN and BUILD and polygon topology 1E into a product, choose 'Make product' needs rebuilding. from the 'lcons' menu. Coverage in which arc features have been rebuilt Coverage containing point features. It but polygon topology still needs rebuilding. 4¢. has a point attribute table (PAT). Layer that is now out-of-date because one or Coverage containing arc features. It has more of its sources has changed. Out-of-date an arc attribute table (AAT). í£. status is only displayed if the 'Out-of-date' option in the 'Diagram' menu is turned on. Derived layer with incomplete command frame. Coverage containing polygon features. It Icon was added to diagram by the 'Create has a polygon attribute table (PAT). from log' option from the 'File' menu and represents the result of a command, such as **RÉSELECT or ELIMINATE. The subcommands of** Coverage with both a point attribute table -## which cannot be extracted from the log 4t and an arc attribute table. A 'dimmed' layer. This layer no longer exists. It has ether been KILLed, or moves to a new Coverage with both an arc attribute table location. Dimmed derived layers are recreated 從日 and a polygon attribute table. with the 'Recreate' option from the 'Update' menu. A dimmed GRID scalar. Icon was added to diagram Grid with integer cell values. with the 'Create from log' option so value is unknown Grid with integer cell values, and a value attribute table (VAT) GUI design by Rupert Essinger Grid with floating point cell values.

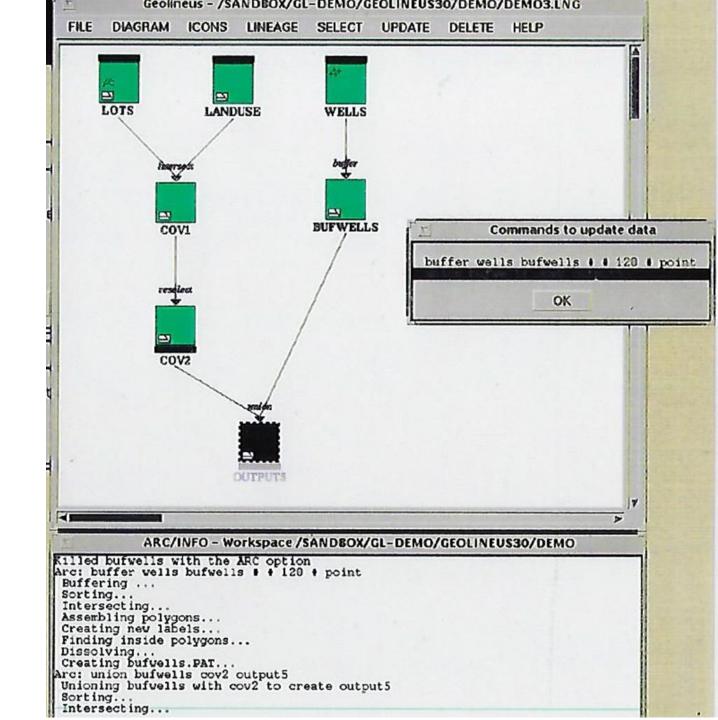

# Working with source and command metadata

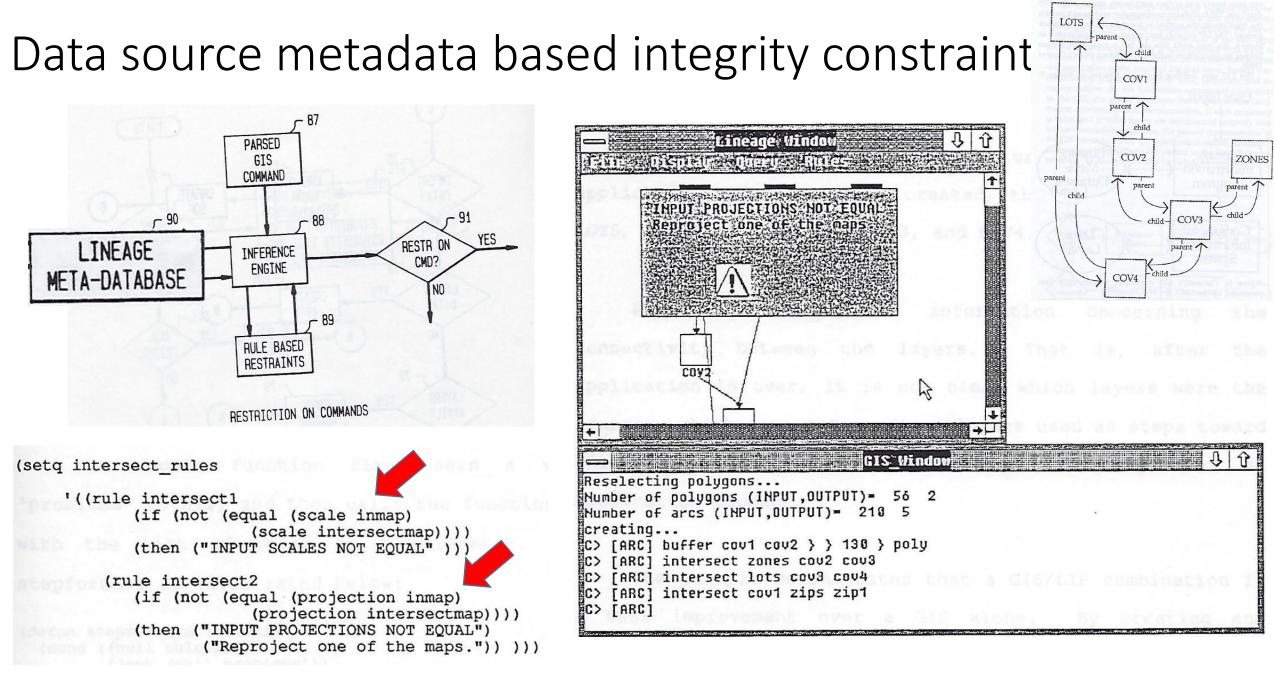

## Update propagation...

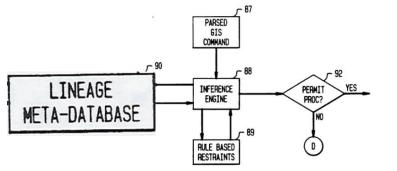

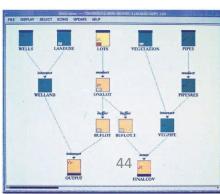

# Data lineage metadata can help information systems meet key data privacy by design requirements, including:

- Enabling data subjects' access, review and rectify their personal data?
- Enable data subjects to withdraw given consent with effect for the future by:
  - a. Blocking access to their personal data?
  - b. Constraining processing and usage of their personal data?
  - c. Erasing their personal data?
- Blocking and restricting personal data obtained for one purpose from being processed for other purposes not compatible with the original purpose

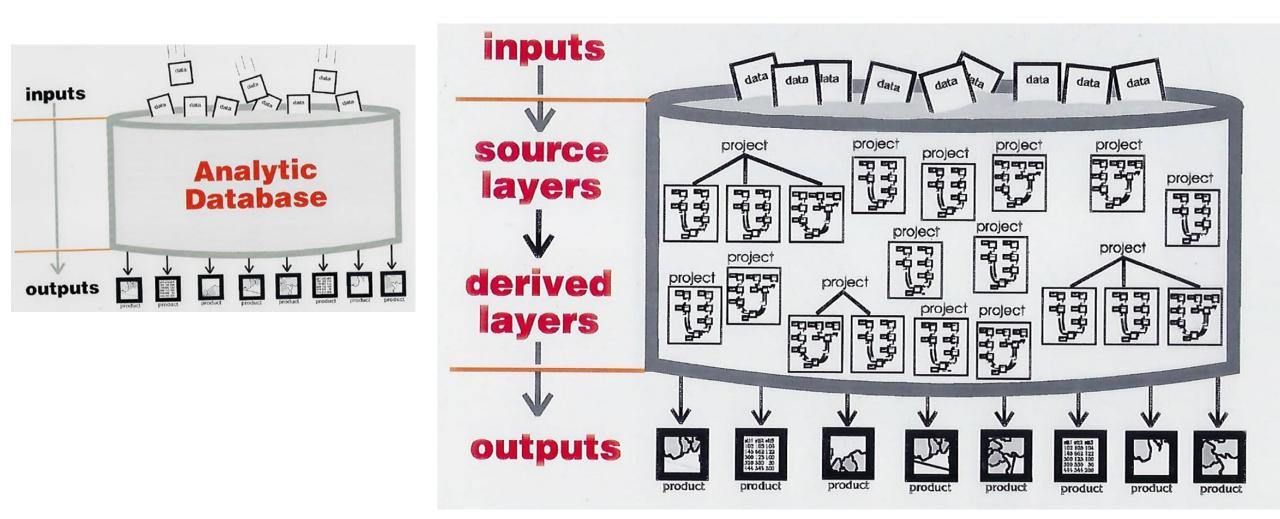

## Case Study: Data lineage metadata enabled audit at Southern California Edison

### Focus of the audit:

- 1. Documentation and understanding of GIS decision support data
- 2. Replicability of data used in decision making

# Data provenance audit problem...

# Metadata Analysis of data and processing

## **Geolineus user guide**

#### Creating a new lineage diagram

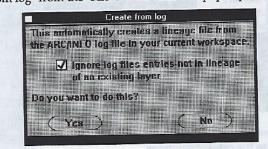

#### Contents

What is Geolineus? What does a lineage diagram show? How does Geolineus store metadata? 9 Working with Geolineus 11 Geolineus demo 13 Creating frame templates 19 Creating a new lineage diagram 22 Documenting source data 24 26 Documenting derived data Documenting product data 29 Deleting icons 30 31 **Deleting data** Recreating deleted data 32 Modifying applications with the "Ripple" button What happens if a ripple can't continue 37 Using "Ripple source" 38 Using "Update" 40 Using "Replace source" 42 Querving a lineage diagram 45 Database view integration with "Merge" Removing redundancies with "Condense" 48 **Re-using lineage diagrams** 50 Index 55

To install Geolineus **B** see the separate 'Geolineus Release N Instructions' document.

The Geolineus "Create from log" option in the "File" menu automatically creates a line ge diagram for an ARC/INFO workspace by reading the workspace's ARC/INFO log file. The workspace log file is maintained by ARC/INFO and records the commands and their parameters that have been performed on the layers in that workspace. When "Create from log" reads a workspace's log file it looks for ARC/INFO commands that process data (see "Help on commands" from the Geolineus "Help" menu for a list of these commands) and creates a lineage diagram to represent the processing.that has taken place.

Make sure you are in the ARC/INFO workspace ( page 11) you want to document.
 Select "Create from log" from the "File" menu. This box pops up (\$).

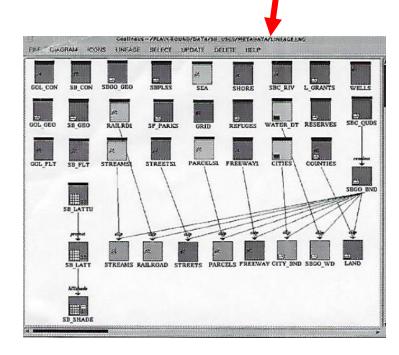

The check option enables you to choose whether or not the diagram that "Create from log" will create will include lineage for layers that no longer exist. Normally, Geolineus will ignore any lines in the log file that do not contribute to the lineage of an existing layer. This results in a lineage diagram that documents the current state of the workspace.

If you uncheck the option, Geolineus creates a diagram using all the lines in the log file, even if they are in the lineage of layers that no longer exist. This results in a diagram showing what has **happened previously** in the workspace in addition to its current state. Use this time for example, to create a diagram from a log file for which the data is unavailable.

Log Files

# Lineage metadata enabled audit of data and processing

9 visits with SCE's GIS Lab's technical staff in 1992, collected:

- 1. Descriptions of 14 data processing projects
- 2. Metadata for data sources that were acquired and imported into the enterprise GIS database for the projects
- 3. Processing log files for the projects

### Lineage metadata enabled audit of data and processing

### at Southern California Edison

1. Descriptions of 14 data processing projects

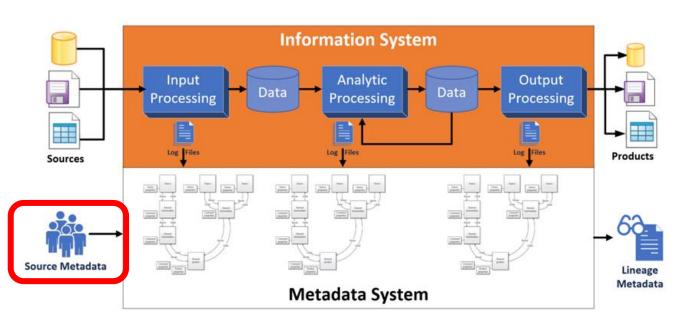

#### ... for 7 corporate divisions were examined:

- Customer Service
- Engineering
- Environmental Research
- Information Services
- Power Generation
- Project Development
- Sewer & Hydrologic Engineering

Project	Output	Deliverable	
1	1 map	Spatial distribution of SCE substations relative to important features	
2	5 maps	SCE's Service Territory and its various features	
3	1 map	SCE's Service Territory and various features	
4	1 map	Areas in Redlands CA near power lines containing sensitive species	
5	1 map	Areas in Victorville CA near transmission lines containing sensitive species	
6	1 map	Route of proposed pipeline from Mandalay facility to Ormond Beach facility	
7	data file	Locations of historic sites in Redlands CA	
8	database	Land use information for species habitat study	
9	1 map	Land use, street network, elevation contours in areas around microwave stations	
10	Map	Land use and street network reference map of Ormond Beach area	
11	21 maps data file	3 maps each for 7 dam/reservoir sites in SCE Territory; Data file of calculated terrain units for use in hydrologic modeling project	
12	database	Environmental site suitability models for locating artificial reef to mitigate impact of San Onofre Nuclear Generation Station as requirement of operation permit	
13	1 map	SCE Service Territory's relationships between switching and intermediate processing centers	
14	2 maps	Congressional boundaries and demographic data	

# Linage metadata enabled audit of data and processing

- 2. Identified data acquired from internal and external sources and collected metadata on these data
  - Entity types ("features") and attribute content
  - Format
  - Area covered
  - Scale and spatial resolution
  - Spatial coordinate system
  - Spatial projection
  - Supplying agency
  - Original source organization
  - Original publication date
  - Production source date
  - Responsible staff member
  - Statement of data quality

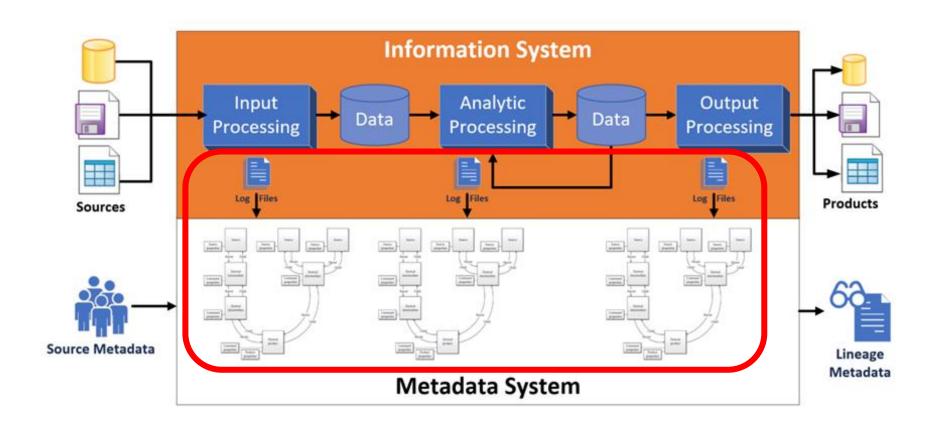

## Metadata enabled audit of data and processing

#### at Southern California Edison

3. Processing log files obtained for each of the 14 projects

Reverse engineer lineage metadata from the log files

GIS Lab analysts identified 54 data files input into the Information System to support their projects, obtained from:

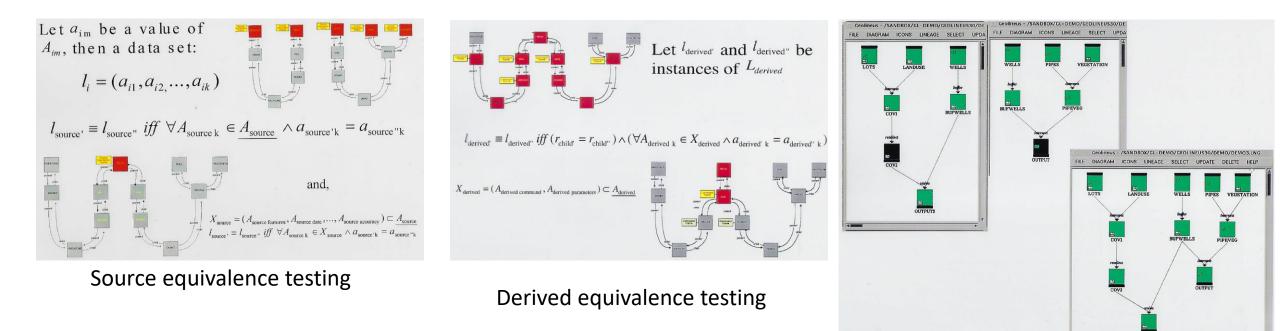

- Internal client department
- Other internal departments
- California state agencies
- Outside consultants

Log processing identified 806 datasets referenced in the log files :

- 487 source datasets (i.e. lacking child links pointing to inputs)
- 319 derived datasets

Next step... would have focused on use of metadata analysis to identify **commonalities and differences** in:

- 1. Source data usage
- 2. Analytical processing logic

#### **But... findings:**

- 1. Much metadata for documenting the data sources were missing...
  - GIS Lab Technical Staff analysts were unable to remember much about the data they had used in earlier projects
  - Of the 54 data files used as input to the GIS database:
    - 68% were from unknown sources
    - 89% were of unknown geographic projections
    - 79% were of unknown collection dates
    - 70% were of unknown geographic scales and spatial accuracy

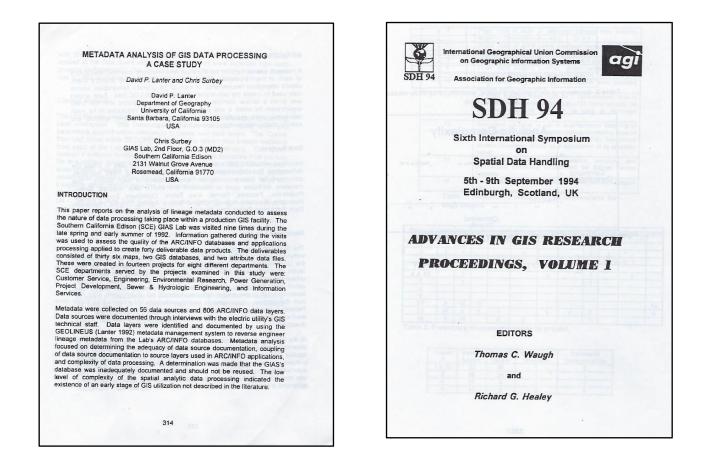

#### Findings:

- 2. Lack of naming conventions blocked identifying primary data sources once they were imported into the Information System
  - For example,
    - "TER" used as mnemonic device to name datasets after import:
      - 5 datasets in Project 1: TERBND, TER.MRK, TERMRK1, TERMRK2, and TERMERK3
      - 3 datasets in Project 2: TERRITORY, SCE-TERR, SCE-TERR2
      - Information Analysts could not differentiate them

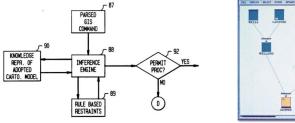

Utility company only had one service territory boundary, there were 8 different versions of it. Without taking the itme to visually inspect and compare the actual data – it was not clear what, if any, significant differences existed among the versions

#### **Recommendation:**

• GIS Lab's "...database was inadequately documented and should not be reused."

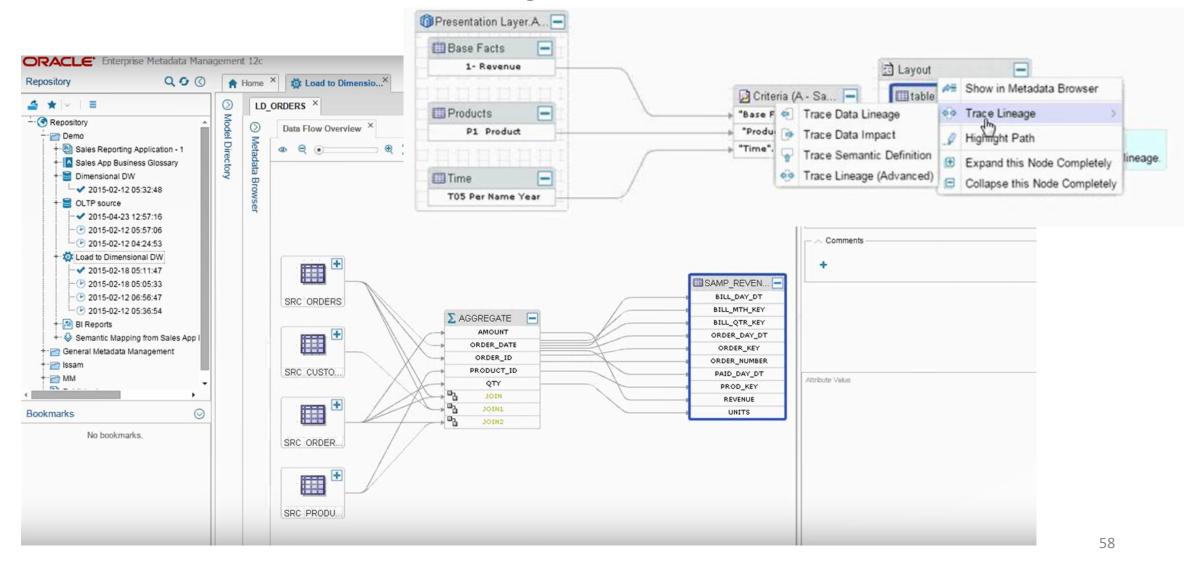

# Conclusion:

Data lineage metadata can be used to help information system developers meet key data protection by design requirements:

- 1. Data subjects have **right to access, review and rectify** their personal data
- 2. Data subjects have the **right to withdraw given consent** with effect for the future and
  - Block access
  - Constrain processing and use
  - Erase their personal data
- 3. Personal data obtained for one purpose must not be processed for other purposes not compatible with the original purpose

**Outlook:** Commercial database management systems are beginning to include lineage metadata capabilities for tracking attribute values processed and transformed among relational database tables ...

# Agenda

Privacy and data protection by design

- Data provenance and data lineage
   Data lineage metadata and its processing
   Audit of SCE's enterprise information processing
   Metadata processing enables data privacy by design
- Lab: Web Privacy and Anonymity

- I Part 4: Anonymous Web Browsing

#### Lab: Web Privacy and Anonymity

By Drs. Anthony Vance and Dave Eargle

This lab will help you learn more about how to protect your privacy on the Web. Perform the steps below on your personal computer, not your Kali VM on Google Cloud.

#### Part 1: Check Out Your Data

Several major companies allow you to check out and examine the data they have on file for you. This can be very revealing.

Use this link to learn how to download your data from one or more of the following services:

- Facebook (highly recommended)
- Instagram
- · Google (If you use Gmail or Google Drive, note that downloads can be large)
- Instagram
- LinkedIn
- Pinterest
- Twitter

Alternatively, see the links below to download your data from these companies:

- Amazon
- Apple
- Snapchat

If you aren't a customer for any of the above companies, try to check out your data for another company you use.

Question: What types of information had this online service collected about you?

Question: Did anything you found in the data about yourself surprise you?

Question: Submit to Canvas as screenshot of the files you obtained from the online service. Don't submit a screenshot of the contents of these files.

#### Part 2: Blocking Web Trackers

Although ad trackers are seemingly everywhere on the Web, the good news is that the newest versions of several major web browsers–such as Firefox, Brave, and Safari for Apple devices–have built-in privacy protections.

# Agenda

## ✓ Privacy and data protection by design

- ✓ Data provenance and data lineage
- $\checkmark$  Data lineage metadata and its processing
- ✓ Audit of SCE's enterprise information processing
- ✓ Metadata processing enables data privacy by design
- ✓ Lab: Web Privacy and Anonymity
