Protecting Information Assets
- Unit# 6b -

Cryptography, Public Key Encryption and Digital Signatures

Agenda

- Cryptography and Cryptanalysis
- Terminology
- Symmetric Cryptography
- Asymmetric Cryptography
- Hashing and Digital Signature
- Public Key Infrastructure
- Cryptanalysis Attacks
- Quiz

Cryptography

- Method of transmitting and storing data in a form that only those it is intended for can read and process
- An effective way of protecting sensitive information as it is transmitted through untrusted network communication paths or stored on media
- Complements physical and logical access controls

The etymology is Greek and means: "*secret writing*"

Where do you look for encryption related controls?

SC-13 CRYPTOGRAPHIC PROTECTION

Control:

a. Determine the [*Assignment: organization-defined cryptographic uses*]; and

b. Implement the following types of cryptography required for each specified cryptographic use: [*Assignment: organization-defined types of cryptography for each specified cryptographic use*].

Discussion: Cryptography can be employed to support a variety of security solutions, including the protection of classified information and controlled unclassified information, the provision and implementation of digital signatures, and the enforcement of information separation when authorized individuals have the necessary clearances but lack the necessary formal access approvals. Cryptography can also be used to support random number and hash generation. Generally applicable cryptographic standards include FIPS-validated cryptography and NSA-approved cryptography. For example, organizations that need to protect classified information may specify the use of NSA-approved cryptography. Organizations that need to provision and implement digital signatures may specify the use of FIPS-validated cryptography. Cryptography is implemented in accordance with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines.

SC-12 CRYPTOGRAPHIC KEY ESTABLISHMENT AND MANAGEMENT

Control: Establish and manage cryptographic keys when cryptography is employed within the system in accordance with the following key management requirements: [*Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction*].

Discussion: Cryptographic key management and establishment can be performed using manual procedures or automated mechanisms with supporting manual procedures. Organizations define key management requirements in accordance with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines and specify appropriate options, parameters, and levels. Organizations manage trust stores to ensure that only approved trust anchors are part of such trust stores. This includes certificates with visibility external to organizational systems and certificates related to the internal operations of systems. [NIST CMVP] and [NIST CAVP] provide additional information on validated cryptographic modules and algorithms that can be used in cryptographic key management and establishment.

Related Controls: AC-17, AU-9, AU-10, CM-3, IA-3, IA-7, SA-4, SA-8, SA-9, SC-8, SC-11, SC-12, SC-13, SC-17, SC-20, SC-37, SC-40, SI-3, SI-7.

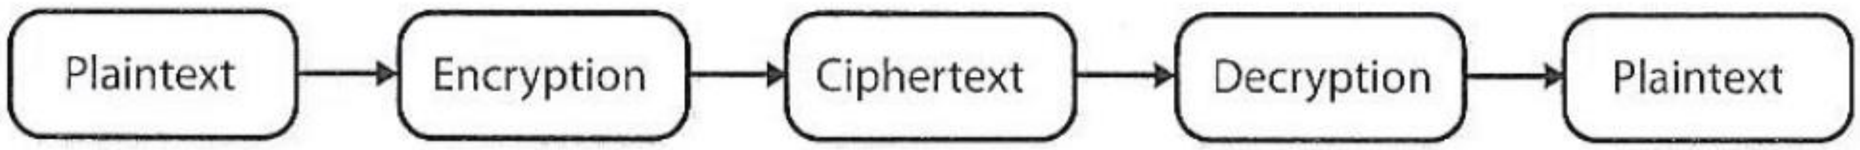
Cryptanalysis

- The study of methods to break cryptosystems
- Often targeted at obtaining a key
- Attacks may be passive or active

- Kerckhoff's Principle
  - The only secrecy involved with a cryptosystem should be the key
- Cryptosystem Strength
  - How hard is it to determine the secret associated with the system?

Terminology

- **Plaintext** – is the readable version of a message
- **Ciphertext** – is the unreadable results after an encryption process is applied to the plaintext
- **Cryptosystem** – includes all the necessary components for encryption and decryption
  - Algorithms
  - Keys
  - Software
  - Protocols



Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Services of cryptosystems

- **Confidentiality** – Renders information unintelligible except by authorized entities
- **Integrity** – Data has not been altered in an unauthorized manner since it was created, transmitted, or stored
- **Authentication** – Verifies the identity of the user or system that created, requested or provided the information
  - ***Authorization*** *– On proving identity, the individual is provided with the key or password that will permit access to some resource*
- **Nonrepudiation** – Ensure the sender cannot deny sending the information

Repudiation – the sender denying he sent the message

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Cipher = encryption algorithm

2 main attributes combined in a cypher

1. **Confusion:** usually carried out through substitution
2. **Diffusion:** Usually carried out through transposition

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Cipher = encryption algorithm

2 main attributes combined in a cypher

1. **Confusion:** usually carried out through substitution
2. **Diffusion:** Usually carried out through transposition

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Example: Substitution cipher or algorithm

- A mono-alphabetic substitution cipher

ABCDEFGHIJKLMNOPQRSTUVWXYZ
ZYXWVUTSRQPONMLKJIHGFEDCBA

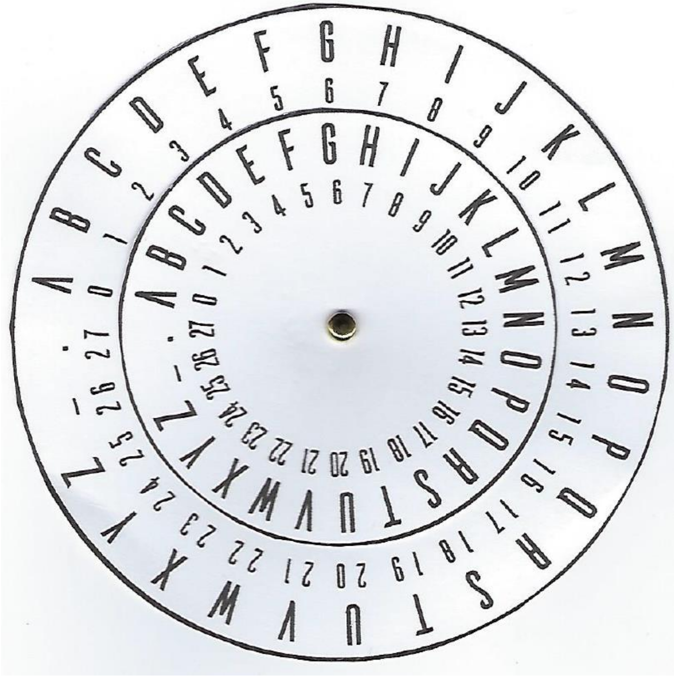
"SECURITY" <=> "HVXFIRGB"

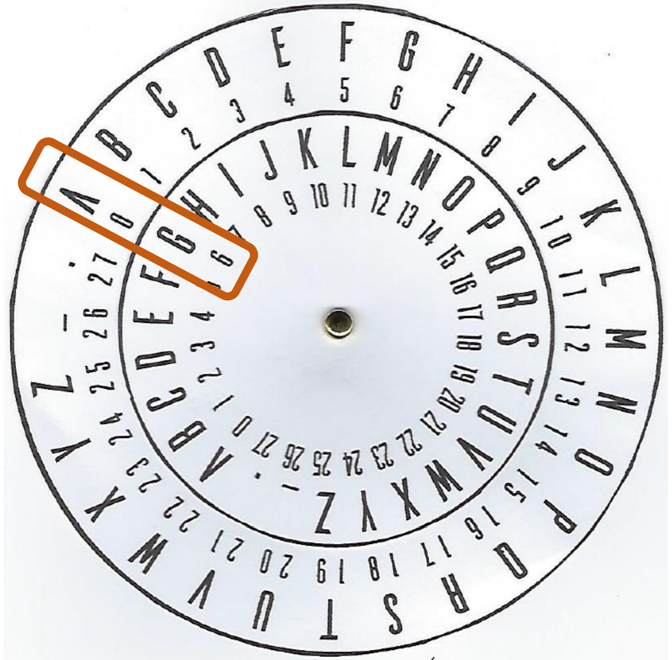
Cipher Disk

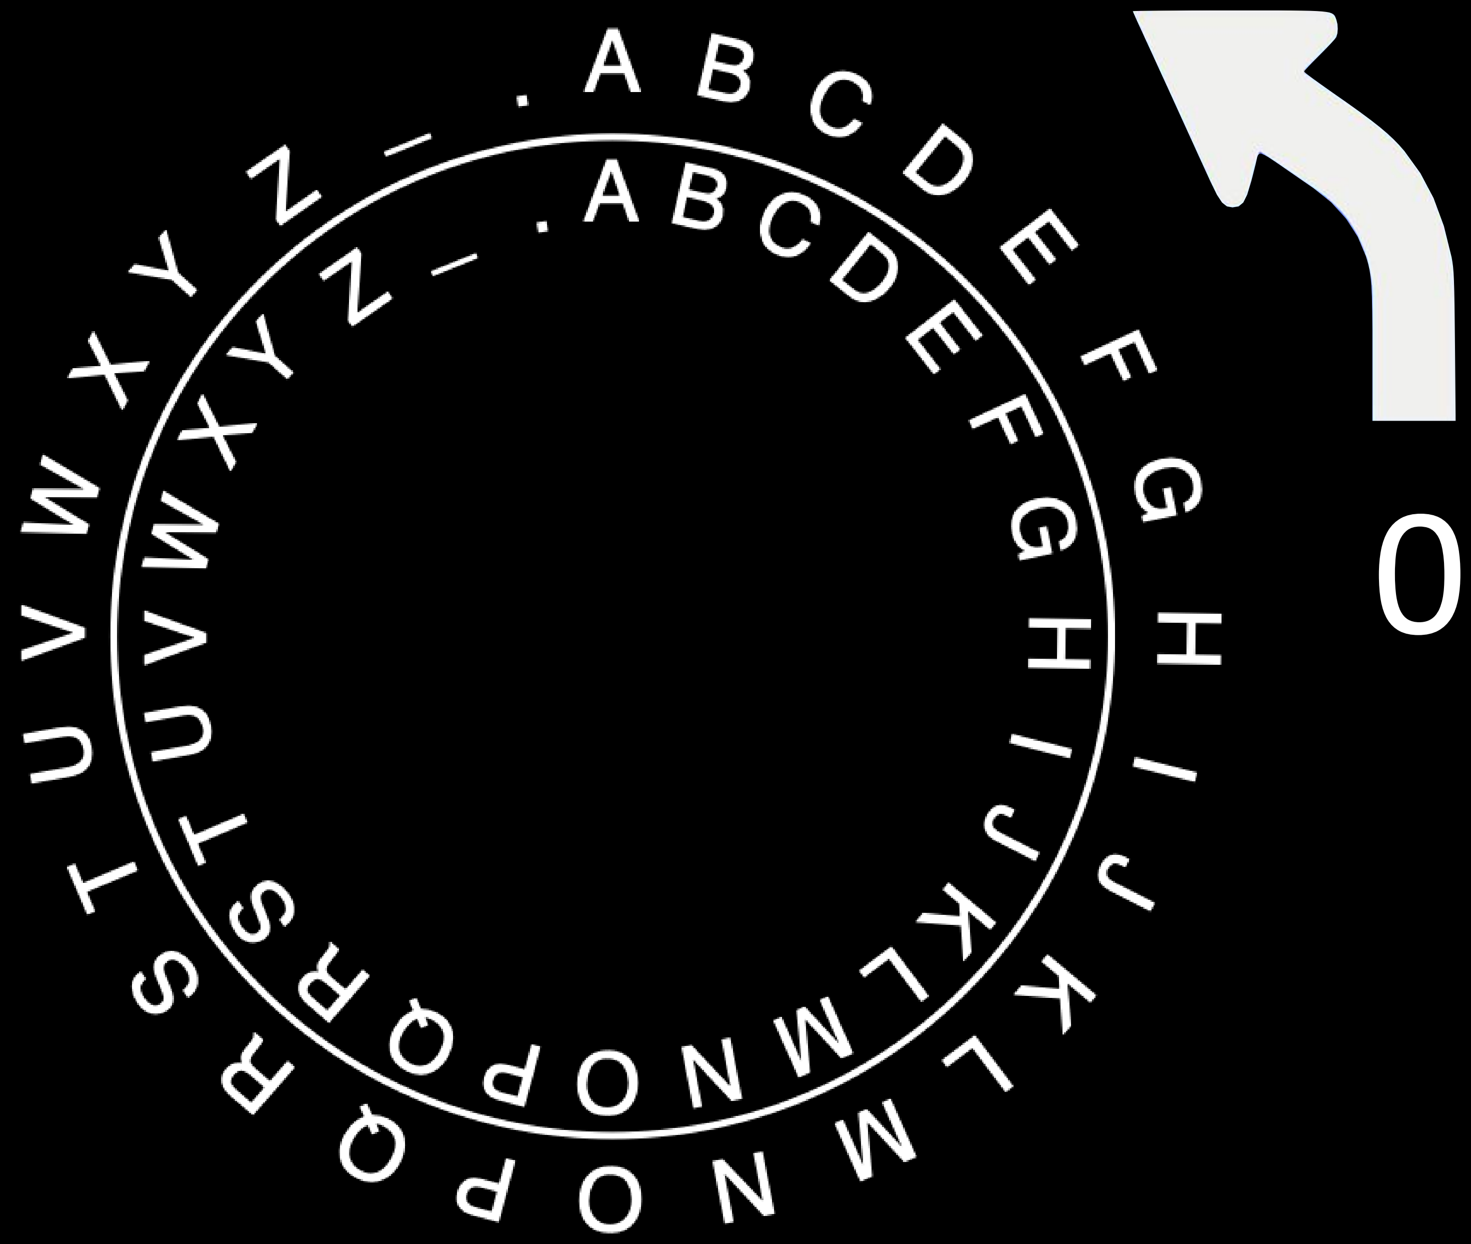
Outer wheel is for the *plaintext* alphabet

Inner wheel is for *ciphertext*

When the outer wheel and inner wheel and are both aligned at the letter “A” (i.e. position zero), there is no encryption mapping the letters on the outer wheel to letters on the inner wheel







. A B C D E F G H I J K L M N O P Q R S T U V W X Y Z _
. A B C D E F G H I J K L M N O P Q R S T U V W X Y Z _
0

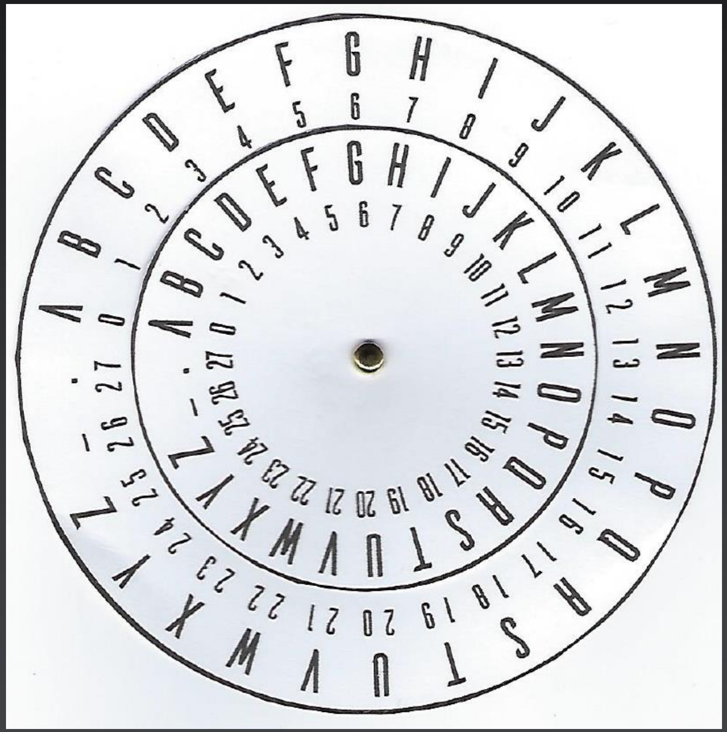
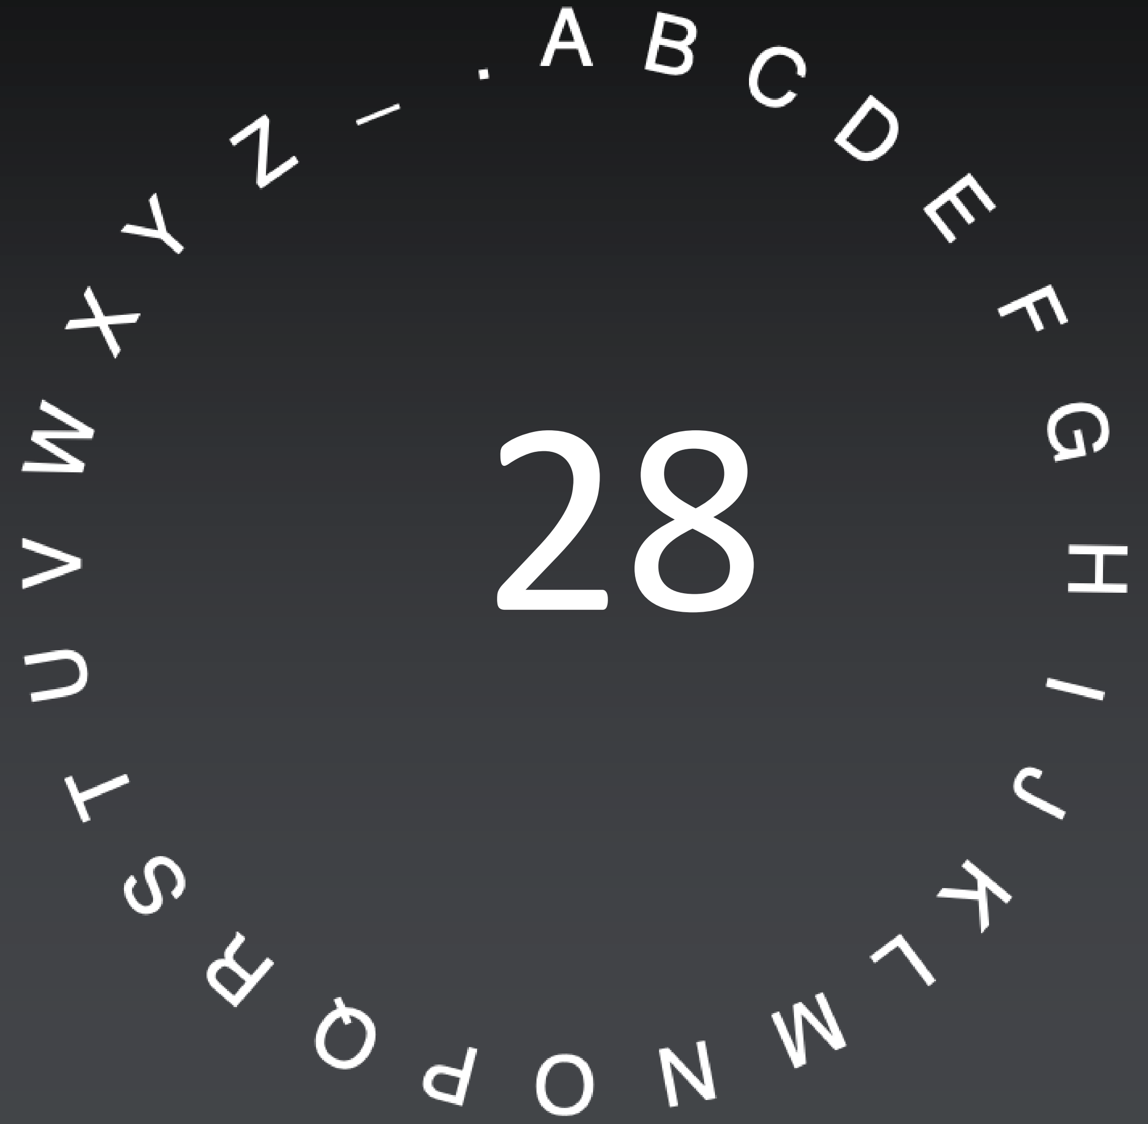
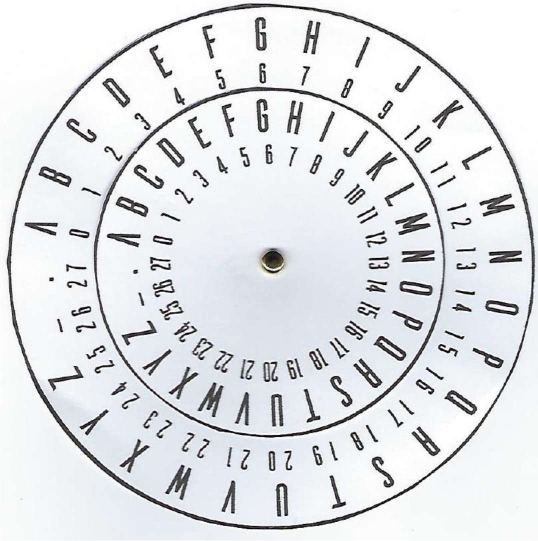
Keyspace is the number of possible keys

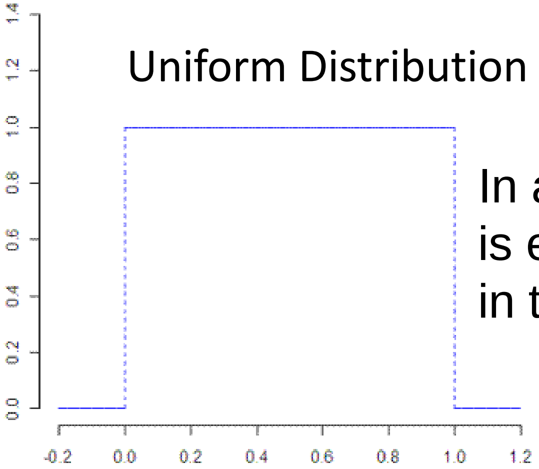




Question: Assuming each key is equally likely (randomly distributed) how many random guesses would you have to make on average to find the key to decrypt the plaintext?



- Answer: ~14, (28 -1) = 27 and 27/2 = 13.5 which is approximately 14
  - Because the <u>average</u> of a uniform distribution is half
  - Recall 26 letters in the alphabet + "." and "-" = 28, but we cannot use "0" as the key which gives us the original plaintext back the size of the alphabet



In a uniform distribution any number is equally likely, the average is right in the middle, or half the distribution

- This is important in cryptography because <u>on average</u> the number of attempts needed to successfully guess the key through brute forcing is half of the **<u>key space</u>**
- This is true of the simple cipher wheel as well as modern encryption schemes with very large key spaces

Linguistic cryptanalysis examples…

- Recognizing the beginning of the word
- Looking for letter pairs
- Looking at vowels

This form of cryptanalysis uses your knowledge of the English language

Linguistic cryptanalysis examples…

One form of linguistic cryptanalysis is *frequency analysis of letters used in English*

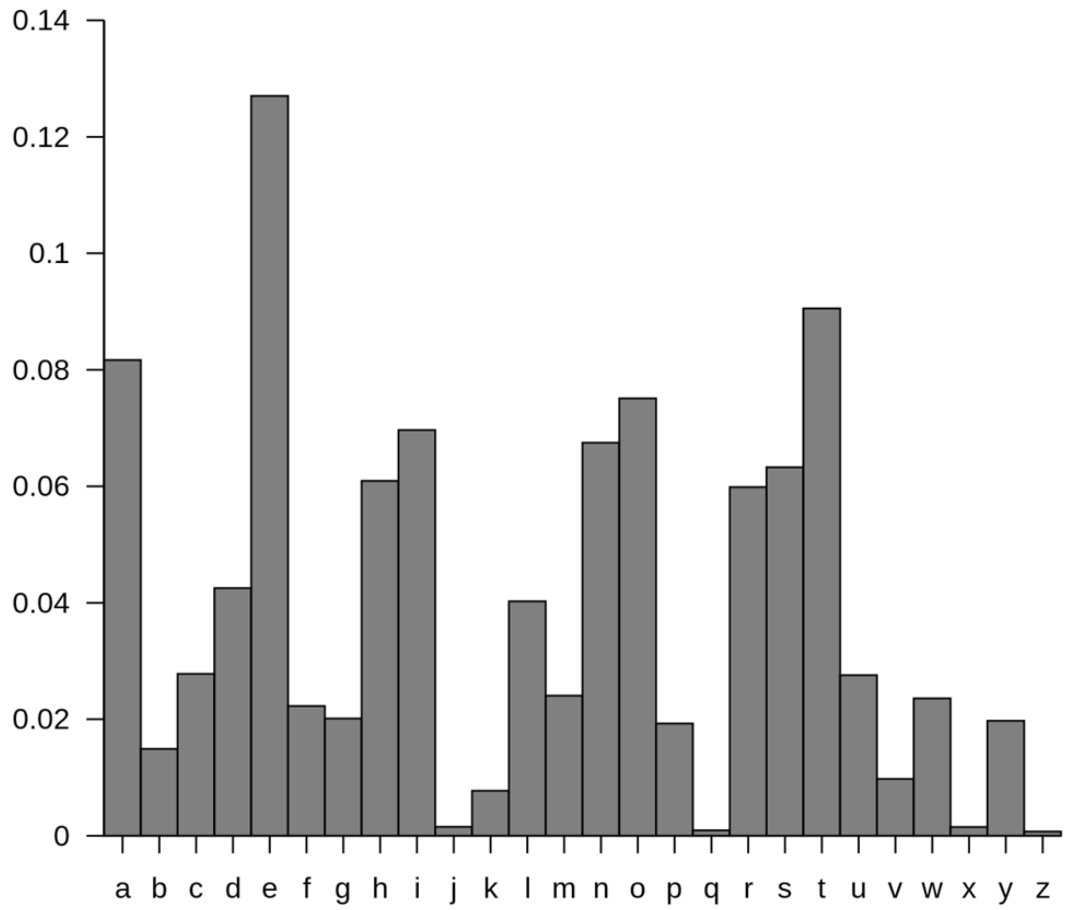
Frequency analysis recognizes that different letters have different probabilities of frequencies of use in words:

Given a sentences written in the English language

- E, T, A and O are the most common
- Z, Q and X are rare

- TH, ER, ON, and AN are the most common pairs of letters (termed bigrams or digraphs)

- SS, EE, TT, and FF are the most common repeats



Example: Substitution cipher or algorithm

- **Standard Alphabet:**
  ABCDEFGHIJKLMNOPQRSTUVWXYZ
- **Cryptographic Alphabet:**
  DEFGHIJKLMNOPQRSTUVWXYZABC

- **Plaintext:**
  LOGICAL SECURITY
- **Ciphertext:**
  ORJLFDO VHFXULWB

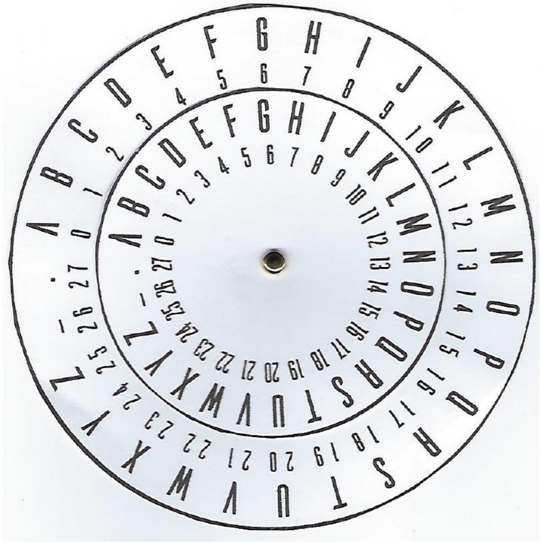
Polyalphabetic Cipher

Ciphers can be made stronger, and frequency analysis made more difficult when more than one cipher alphabet is used

- For example, encrypt the plaintext message “SEND MONEY”
    - Use the word “SECURITY” as the key, but repeat its use in the key to make it have as many letters as the plaintext:

Plaintext: SEND MONEY (10 characters including the space “_”)

Key: SECURITYSE (10 characters)

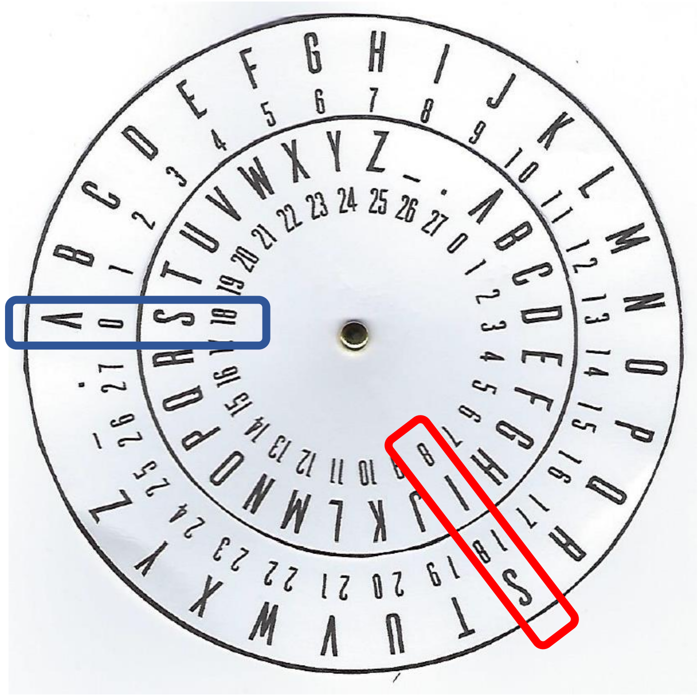


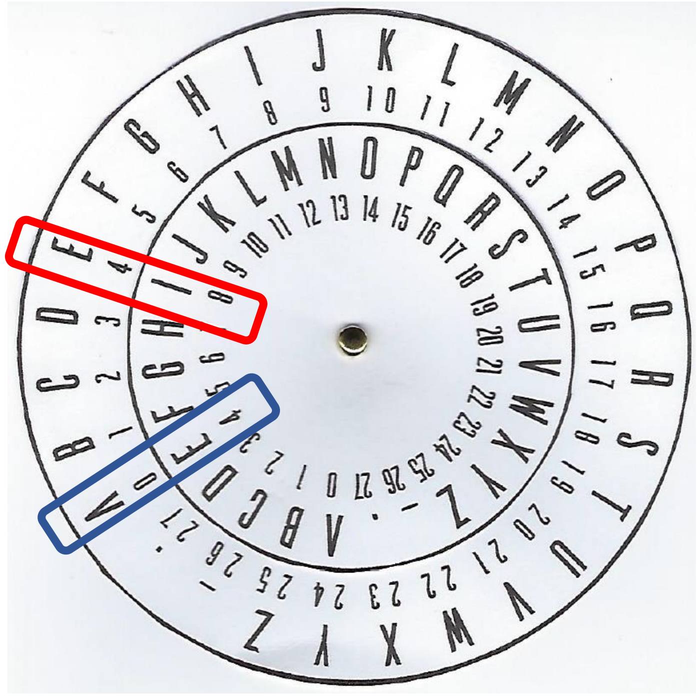
Polyalphabetic Cipher

Plaintext: SEND MONEY (10 characters including the space "_")

Key: SECURITYSE (10 characters)

1. Encrypt by rotating the inner wheel so that "S" in the word "SECURITY" aligns with "A" on the outer wheel
   Now "S" in the word "SEND" on the outer wheel maps to the letter "I" on the inner wheel, so "I" is the ciphertext
2. Next, rotate the inner wheel so that "E" in the word "SECURITY" aligns with "A" on the outer wheel. Now "E" in the word "SEND" on the outer wheel maps to "I" on the inner wheel, so "I" is the ciphertext again, even though the plaintext is different than before





Ciphertext for "SEND MONEY" using the polyalphabetic key "SECURITY" is: IIPXPUFJWA

Polyalphabetic ciphers make frequency analysis more difficult

Polyalphabetic substitution is another building block of cryptography

Random Polyalphabetic Cipher

What if we use a random polyalphabetic key that is as long as the message?

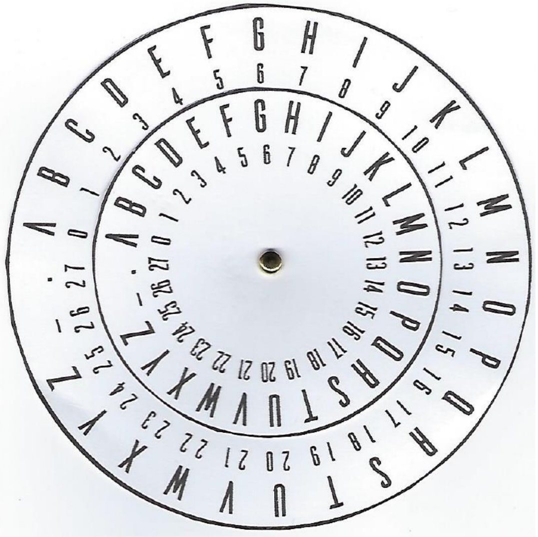
For example, let's say our <u>plaintext</u> is:

We intend to begin on the first of February unrestricted submarine warfare.

And the polyalphabetic <u> key </u> is a string of random characters as long as the message:

ackwulsjwkblogbzcukn.kqubpnnefjvcebuymaclzvzmzwfbxpmmzqwmm.tejzf

Question: How would an attacker could attempt to crack this message?
Is an attack possible?



Cipher = encryption algorithm

2 main attributes combined in a cypher

1. **Confusion:** usually carried out through substitution
    - *Let's look at another way to do substitution*

2. **Diffusion:** Usually carried out through transposition

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

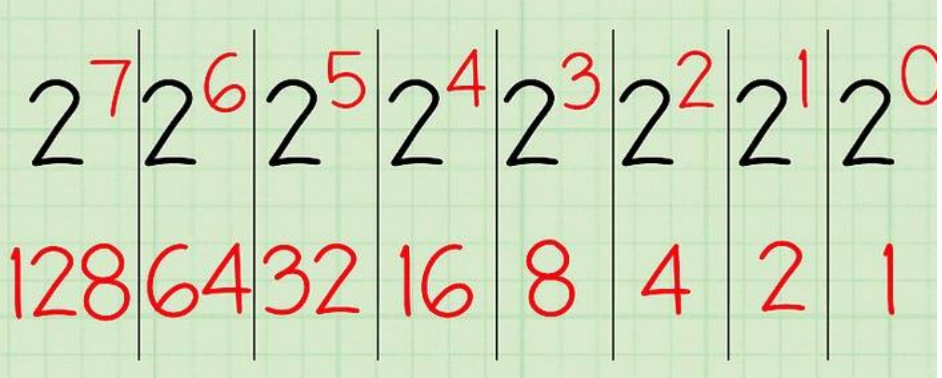
The translation of what we type into ASCII, and then into binary is what is sent in data packets across the network to other computers…

Binary – Decimal

0 0 0 0 0 0 0 0 = 0

1 1 1 1 1 1 1 1 = 255

8 bits supports 256 numbers



ASCII - Decimal

Dec	Hex	Name	Char	Ctrl-char	Dec	Hex	Char	Dec	Hex	Char	Dec	Hex	Char
0	0	Null	NUL	CTRL-@	32	20	Space	64	40	@	96	60	`

9	39	057	K	4B	075	V	56	086			

XOR – Exclusive OR

Creating "confusion" through substitution with a binary mathematical function called "exclusive OR", abbreviated as XOR

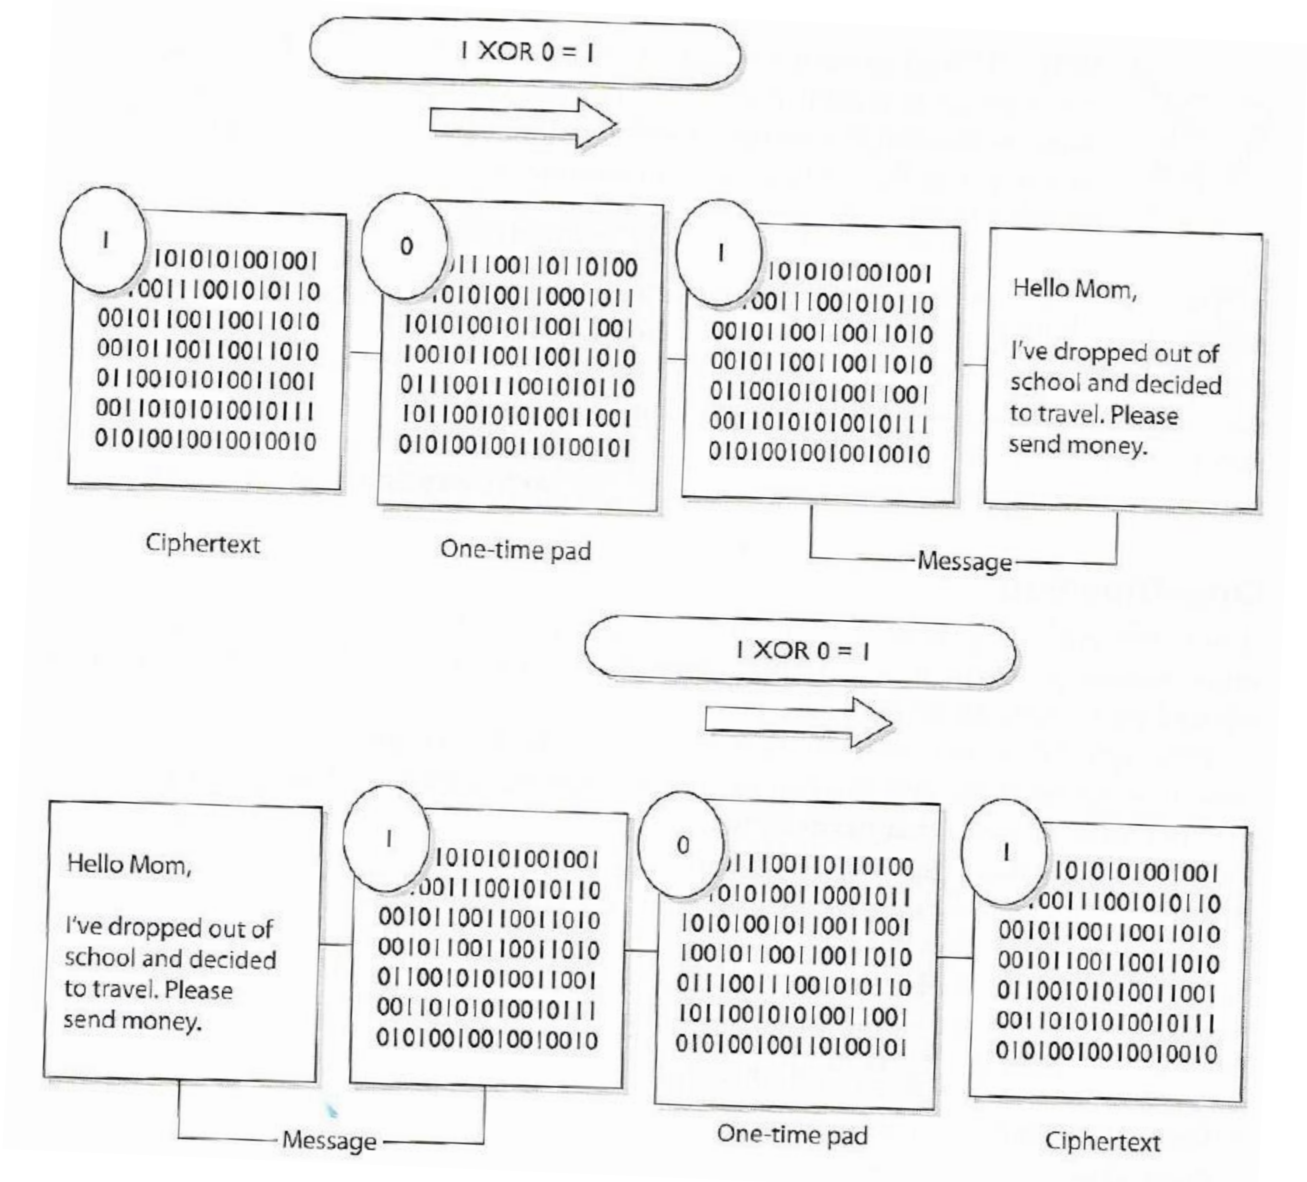
Message stream:	1001010111
Keystream:	0011101010
Ciphertext stream:	1010111101

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

One-Time Pad *a perfect encryption scheme*

One-Time Pad Requirements

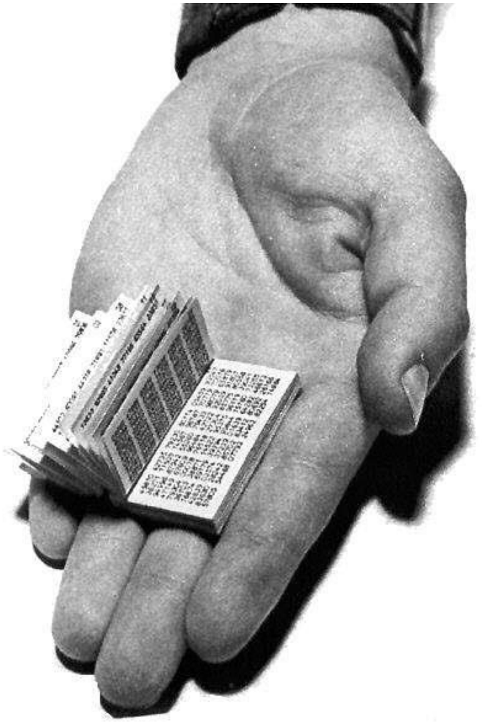
- Made up of truly random values
- Used only one time
- Securely distributed to its destination
- Secured at sender's and receiver's sites
- At least as long as the message



Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

One-time pad -- Problems

- Must be *perfectly random*
- Pad must be as long as the message
- Must be used **only once**
  - Skimp on any of these conditions, it becomes trivial to break your system
- Any software product claiming to use one-time pad is **snake-oil**.
  - Computers are bad at generating *truly* random numbers



Cipher = encryption algorithm

2 main attributes combined in a cypher

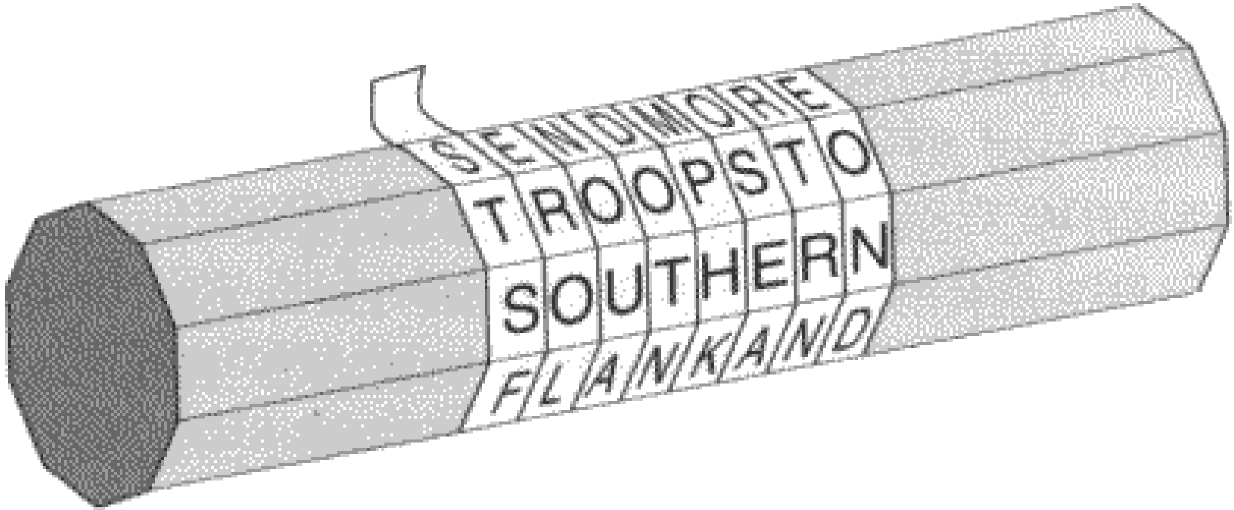
1. **Confusion:** usually carried out through substitution

2. **Diffusion:** Usually carried out through transposition

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Transposition

- Ancient example: [scytale]



A profit was achieved by our ACT unit

a p r o f i t wa s
a c h i e v e d b y
o u r a c t u n i t

0 1 2 3 4 5 6 7 8 9

a p r o f i t w a s

a c h i e v e d b y

o u r a c t u n i t

6	0	2	5	4	8	7	1	3	9
t	a	r	i	f	a	w	p	o	s
e	a	h	v	e	b	d	c	i	y
u	o	r	t	c	i	n	u	a	t

0 1 2 3 4 5 6 7 8 9

a p r o f i t w a s

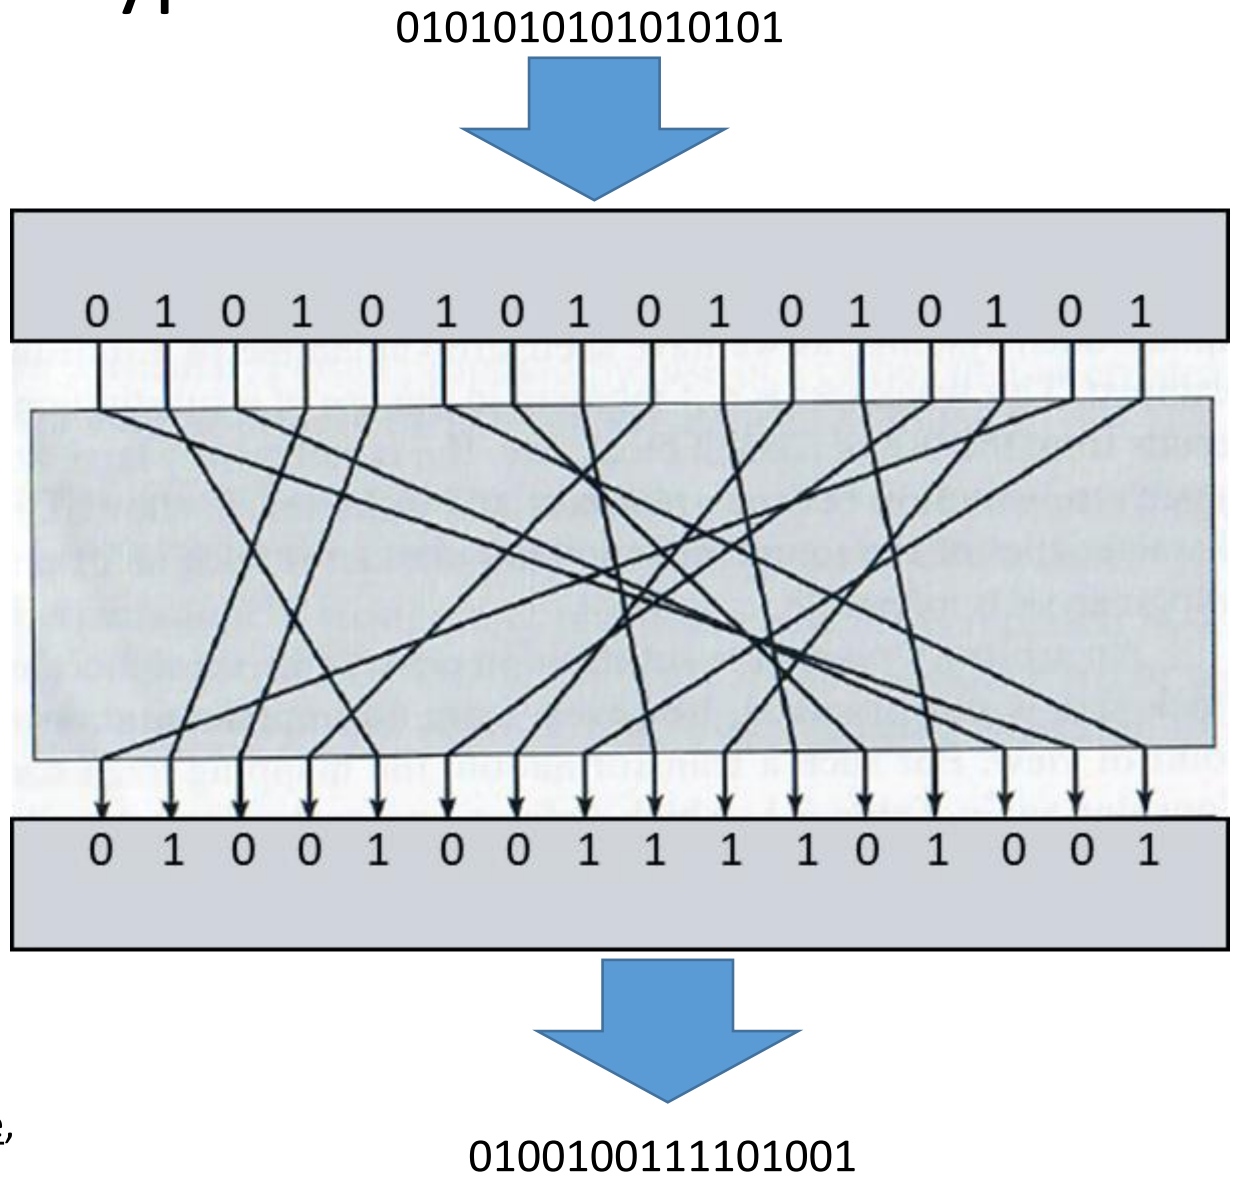
a c h i e v e d b y

o u r a c t u n i t

2 main attributes combined in a cypher

1. Confusion: usually carried out through substitution

2. **Diffusion:** Usually carried out through transposition



Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Examples of dichotomies in cryptography

- Symmetric versus Asymmetric
- Stream versus block
- 1-Way functions versus 2-Way functions

Symmetric versus asymmetric algorithms

- Symmetric cryptography
  - Use a copied pair of symmetric (identical) secret keys
  - The sender and the receive use the same key for encryption and decryption functions
- Asymmetric cryptography
  - Also know as “public key cryptography”
  - Use different (“asymmetric”) keys for encryption and decryption
  - One is called the “private key” and the other is the “public key”

Symmetric cryptography

Strengths:

- Much faster (less computationally intensive) than asymmetric systems.
- Hard to break if using a large key size.

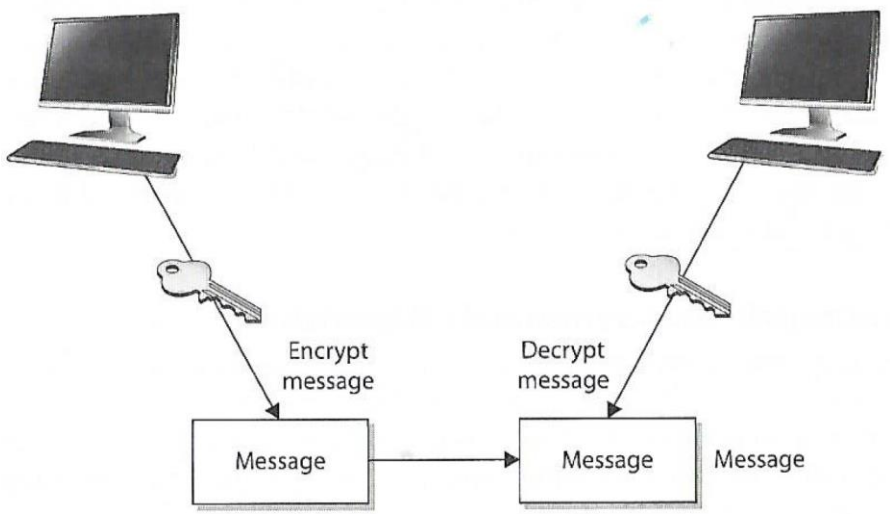
Weaknesses:

- Requires a secure mechanism to deliver keys properly.
- Each pair of users needs a unique key, so as the number of individuals increases, so does the number of keys, possibly making key management overwhelming.
- Provides confidentiality but not authenticity or nonrepudiation.

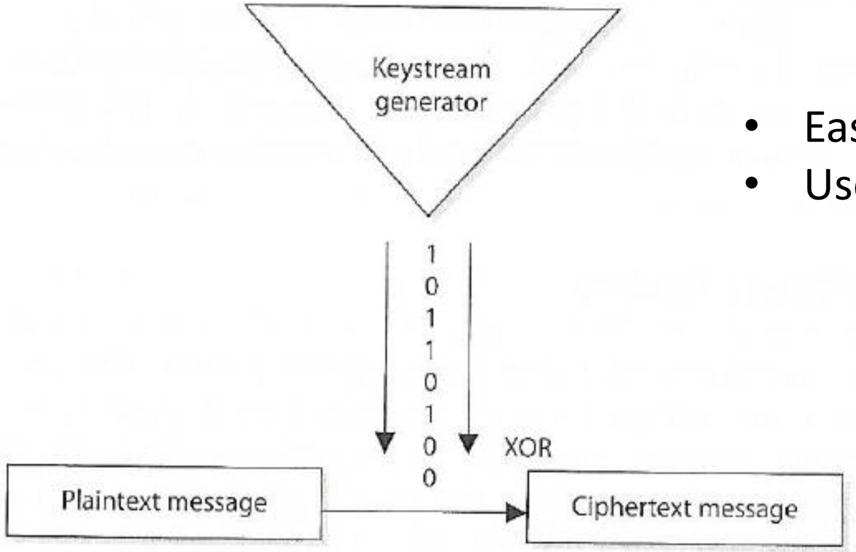
Two types: Stream and Block Ciphers

- **Stream Ciphers** treat the message a stream of bits and performs mathematical functions on each bit individually
- **Block Ciphers** divide a message into blocks of bits and transforms the blocks one at a time

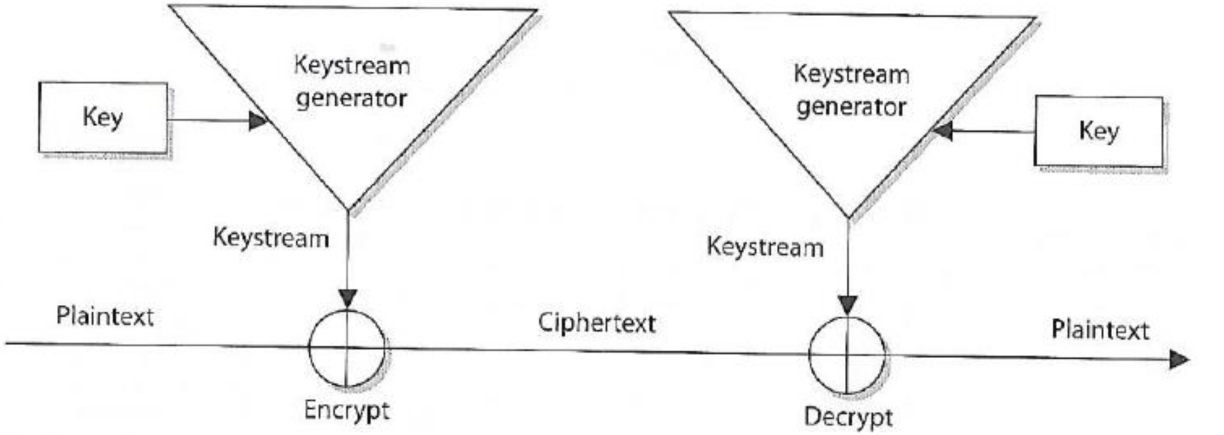
Symmetric encryption uses the same keys.



Symmetric Stream Ciphers



- Easy to implement in hardware
- Used in cell phones and Voice Over Internet Protocol



The sender and receiver must have the same key to generate the same keystream.

Harris, S. and Maymi, F. (2016) <u>All-In-One CISSP Exam Guide</u>, McGraw Hill Education

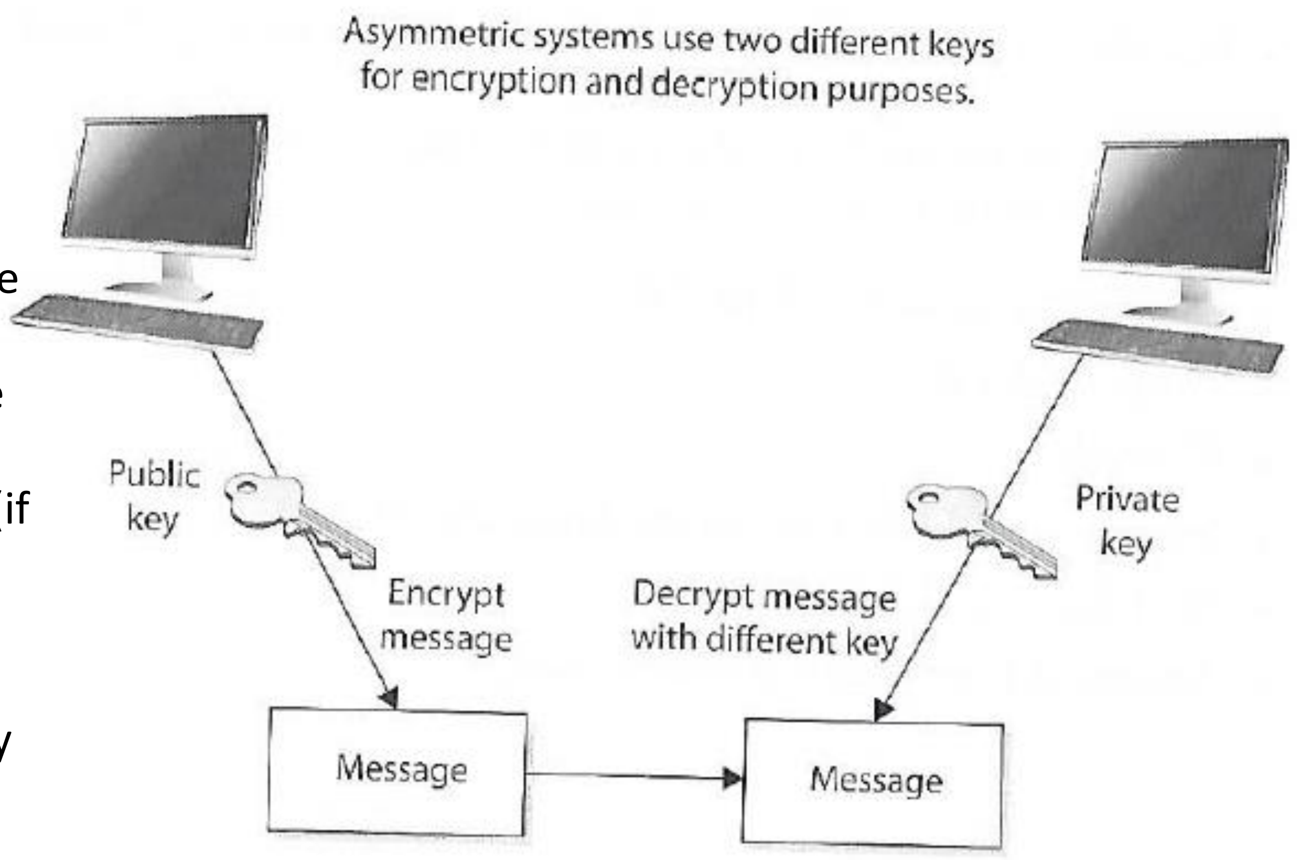
Symmetric versus asymmetric algorithms

- Symmetric cryptography
  - Use a copied pair of symmetric (identical) secret keys
  - The sender and the receive use the same key for encryption and decryption functions
- Asymmetric cryptography
  - Also know as “public key cryptography”
  - Use different (“asymmetric”) keys for encryption and decryption
  - One is called the “private key” and the other is the “public key”

Asymmetric cryptography

- **Public and Private** keys are mathematically related
    - Public keys are generated from private key
    - Private keys cannot be derived from the associated public key (if it falls into the wrong hands)

- **Public key** can be known by everyone
- **Private key** must be known and used only by the owner



Asymmetric cryptography is computational intensive and much slower than symmetric cryptography

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Asymmetric cryptography

- Do not get confused and think the public key is only for encryption and private key is only for decryption!

- Each key type can be use used to encrypt and decrypt
  - If data is encrypted with a private key it cannot be decrypted with the same private key (but it can be decrypted with the related public key)
  - If data is encrypted with a public key it cannot be decrypted with the same public key (but it can be decrypted with the related private key)

Asymmetric cryptography

If the sender ("Jill") encrypts data with her private key, the receiver ("Bill") must have a copy of Jill's public key to decrypt it

- By decrypting the message with Jill's public key Bill can be sure the message really came from Jill
- A message can be decrypted with a public key only if the message was encrypted with the corresponding private key
  - *This provides* ***authentication*** *because Jill is only the only one who is supposed to have her private key*

If Bill (the receiver) wants to make sure Jill is the only one who can read his reply, he will encrypt the response with her public key

– *Only Jill will be able to decrypt the message, because she is the only one who has the necessary private key*

– *This provides* ***confidentiality*** *because only Jill is able to decrypt the message with her private key*

Asymmetric cryptography

Why would Bill (now the sender) choose to encrypt his reply to Jill with his private key instead of using Jill's public key?

- **Authentication** – Bill wants Jill to know that the message came from him and no one else
- If he encrypted the data with Jill's public key, it does not provide authenticity because anyone can get Jill's public key
- If he uses his private key to encrypt the data, then Jill can be sure the message came from him and no one else

Note: *Symmetric keys do not provide authenticity – because the same key is used on both ends (using one of the secret keys does not ensure the message originated from a specific individual*

Asymmetric cryptography

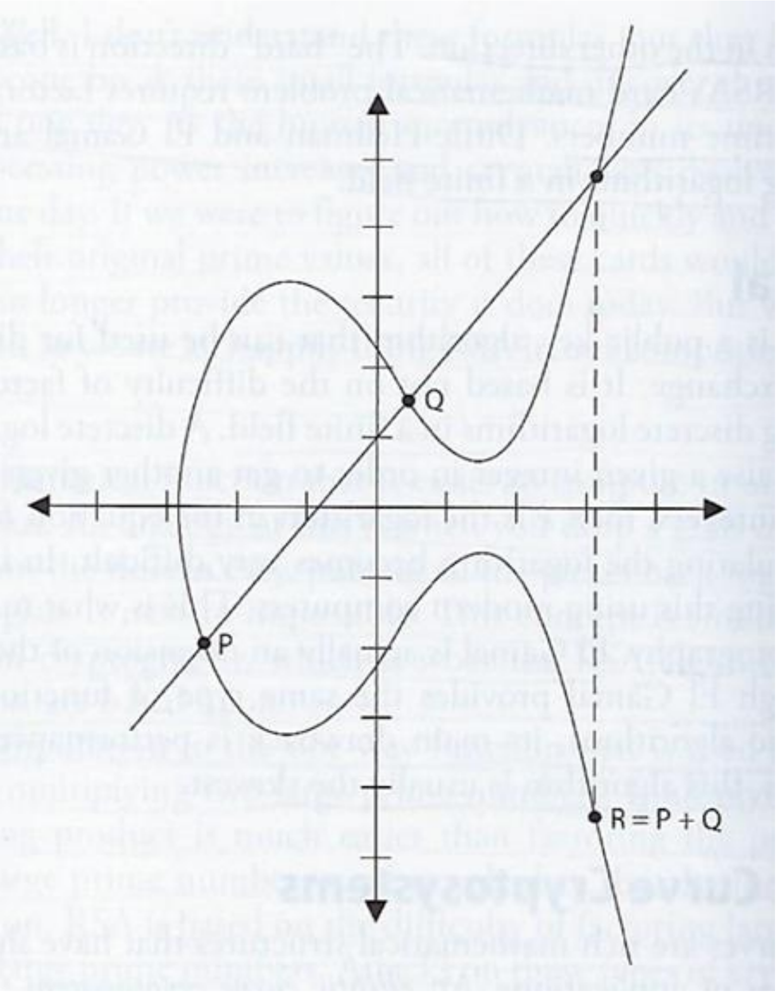
- If **confidentiality** is the most important security service, the sender would encrypt the file with the receiver's public key
  - This is called a "**secure message format**" because it can only be decrypted by the person with the corresponding private key

- If **authentication** is most important, the sender would encrypt the data with his private key
  - This provides assurance to the receiver that the only person who could have encrypted the data is the individual in possession of the private key
  - If the sender encrypted the data with receivers public key, authentication is not provided because the public key is available to anyone
  - Encrypting data with the senders private key is called an "**open message format**" because anyone with a copy of the corresponding public key can decrypt the message
  - <u>Confidentiality is not assured</u>

Cryptographic algorithms and their functions

Elliptical curve cryptography (ECC) is a public key encryption technique (Asymmetric)

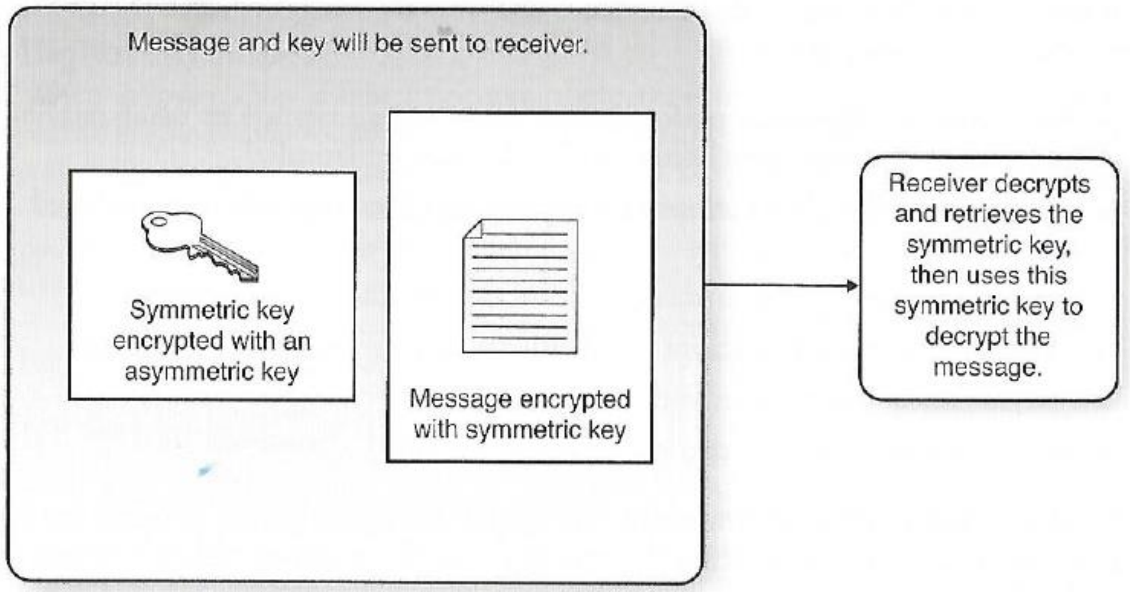
- Based on elliptic curve theory that can be used to create faster, smaller, and more efficient cryptographic keys
- ECC generates keys through the properties of the elliptic curve equation instead of the traditional method of generation as the product of very large prime numbers



Hybrid Encryption (a.k.a. “digital envelope”)

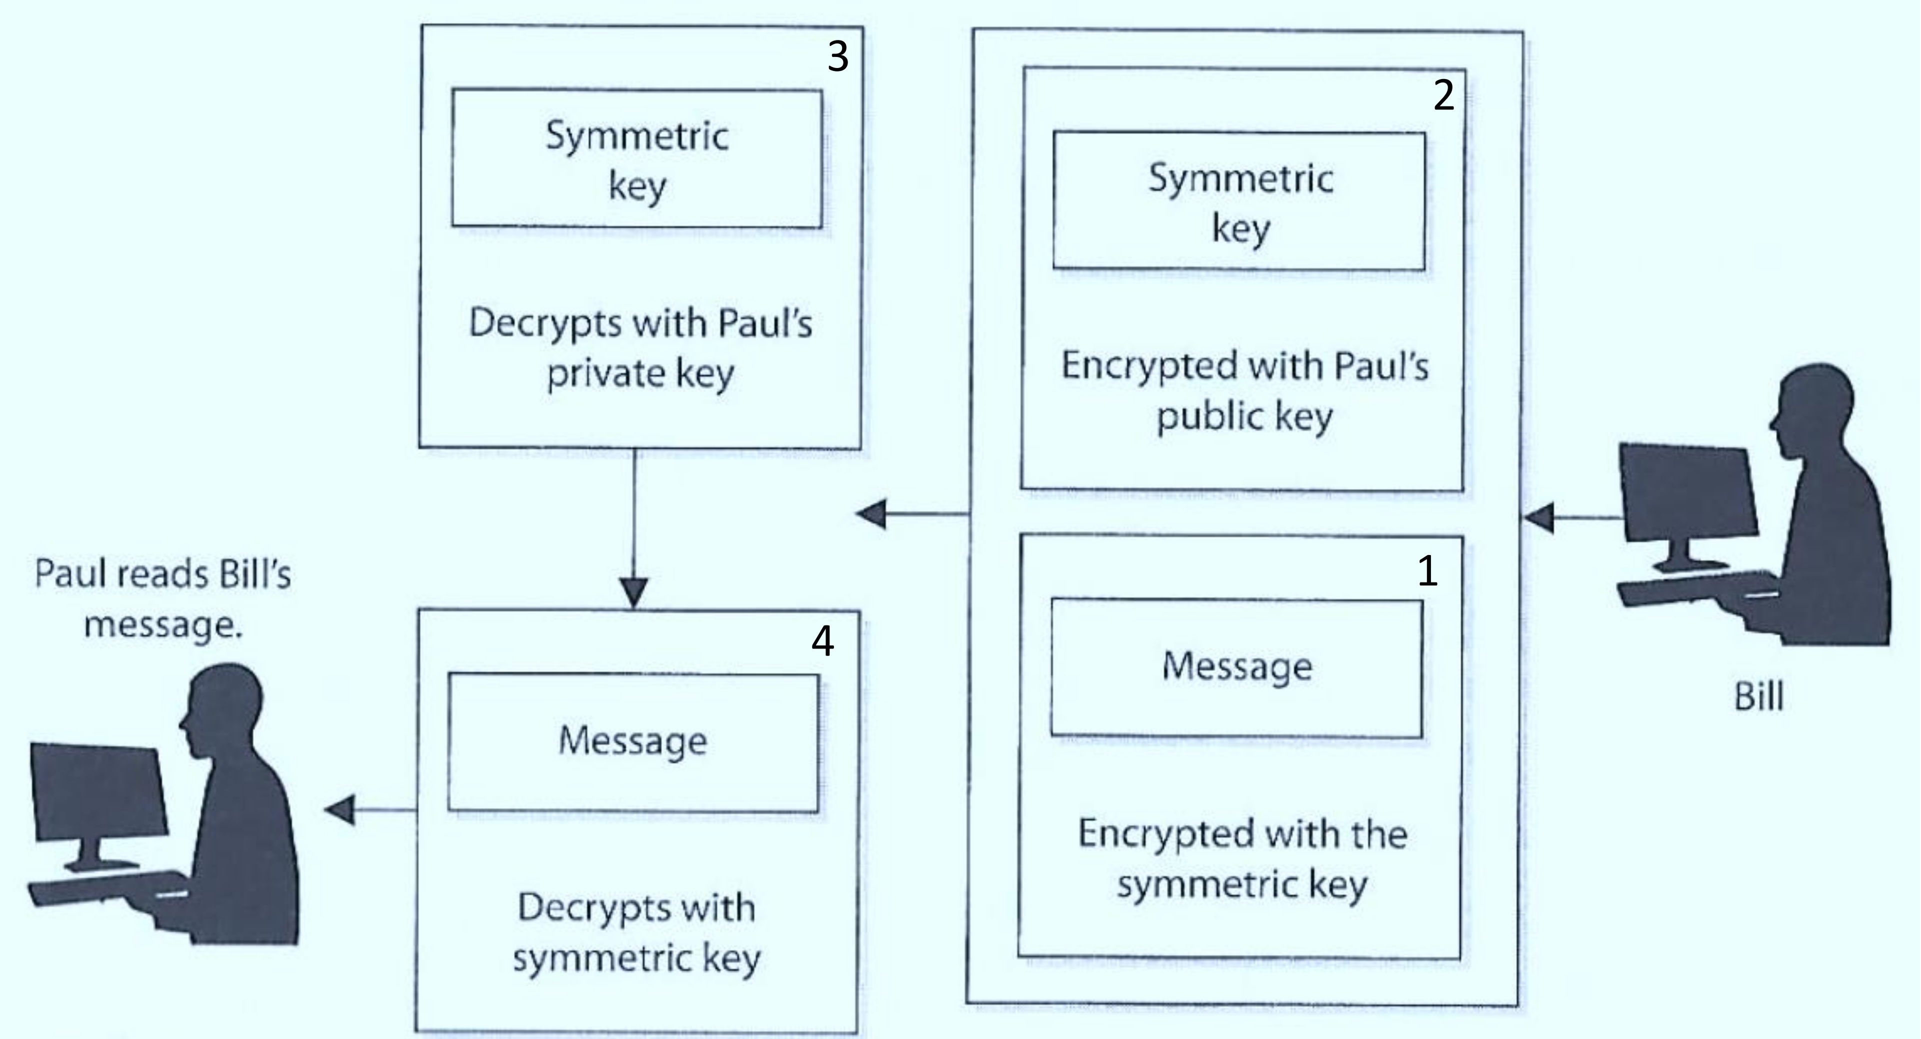
Symmetric and asymmetric and algorithms are often used together

- Public key cryptography’s asymmetric algorithm is used to create public and private keys for secure automated key distribution
- Symmetric algorithm is used to create secret keys for rapid encryption/decryption of bulk data



Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

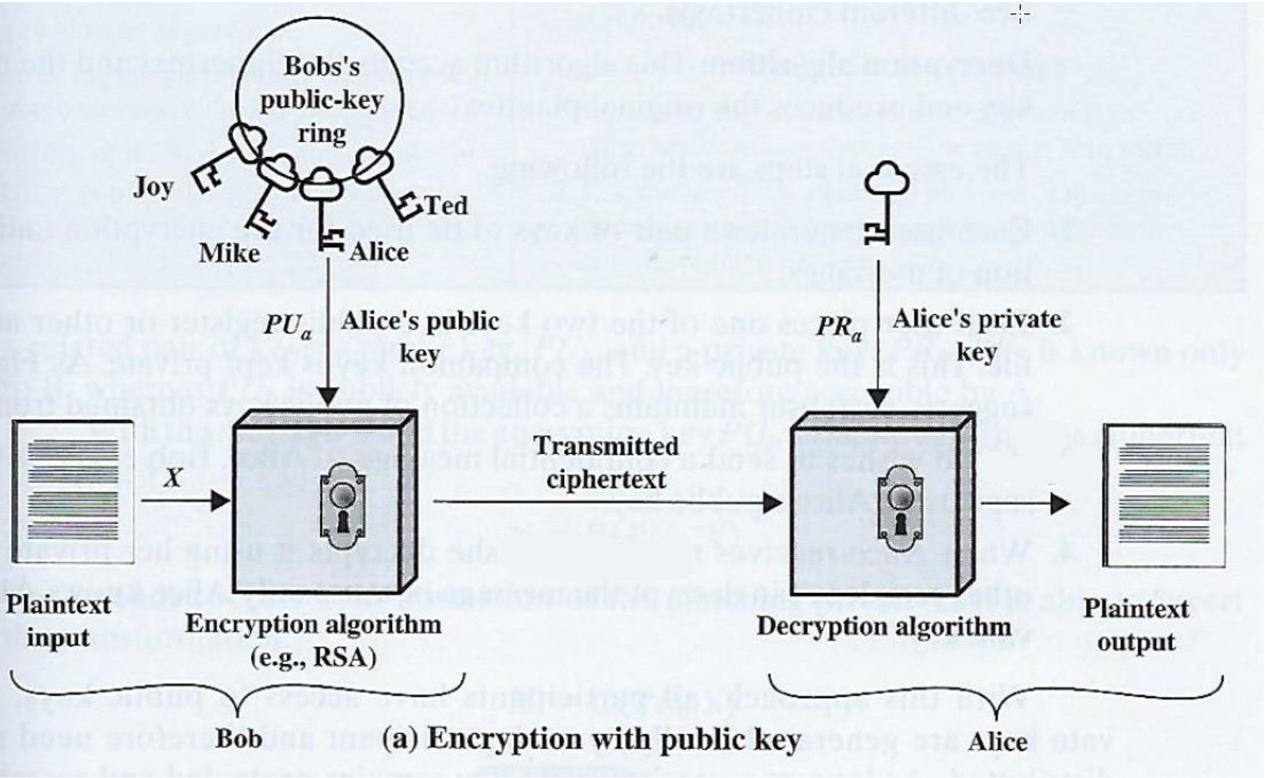
Hybrid Encryption



Symmetric algorithm uses a secret key to encrypt the message and the asymmetric key encrypts the secret key for transmission (SSL/TLS uses hybrid)

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Public Key Management



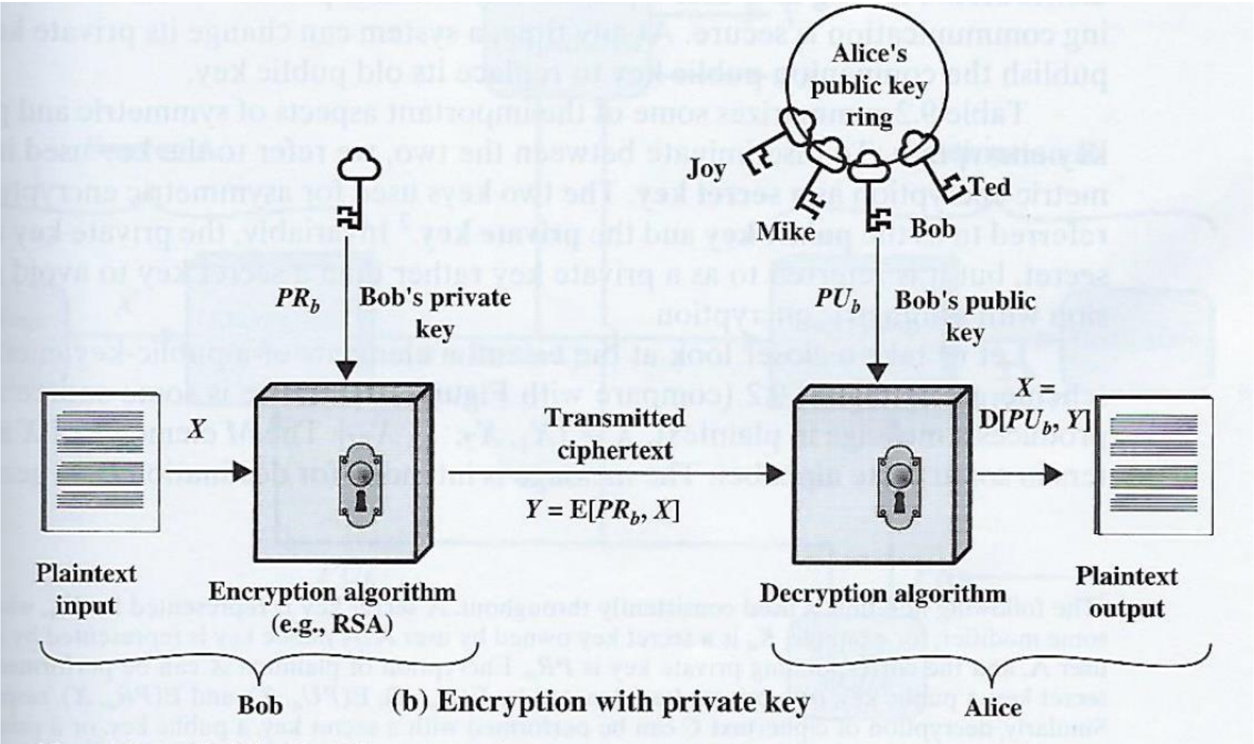


Figure 9.1 Public-Key Cryptography

Stallings, W. (2014) Cryptography and Network Security

Quick review

1. If a symmetric key is encrypted with a receiver's public key, what security service is provided?

Quick review

1. If a symmetric key is encrypted with a receiver’s public key, what security service is provided?
    - **Confidentiality**: only the receiver’s private key can be used to decrypt the symmetric key, and only the receiver should have access to this private key

Quick review

2. If data is encrypted with the sender's private key, what security services is provided?

Quick review

2. If data is encrypted with the sender's private key, what security services are provided?
   - **Authenticity** of the sender and nonrepudiation. If the receiver can decrypt the encrypted data with the sender's public key, then receiver knows the data was encrypted with the sender's private key

Quick review

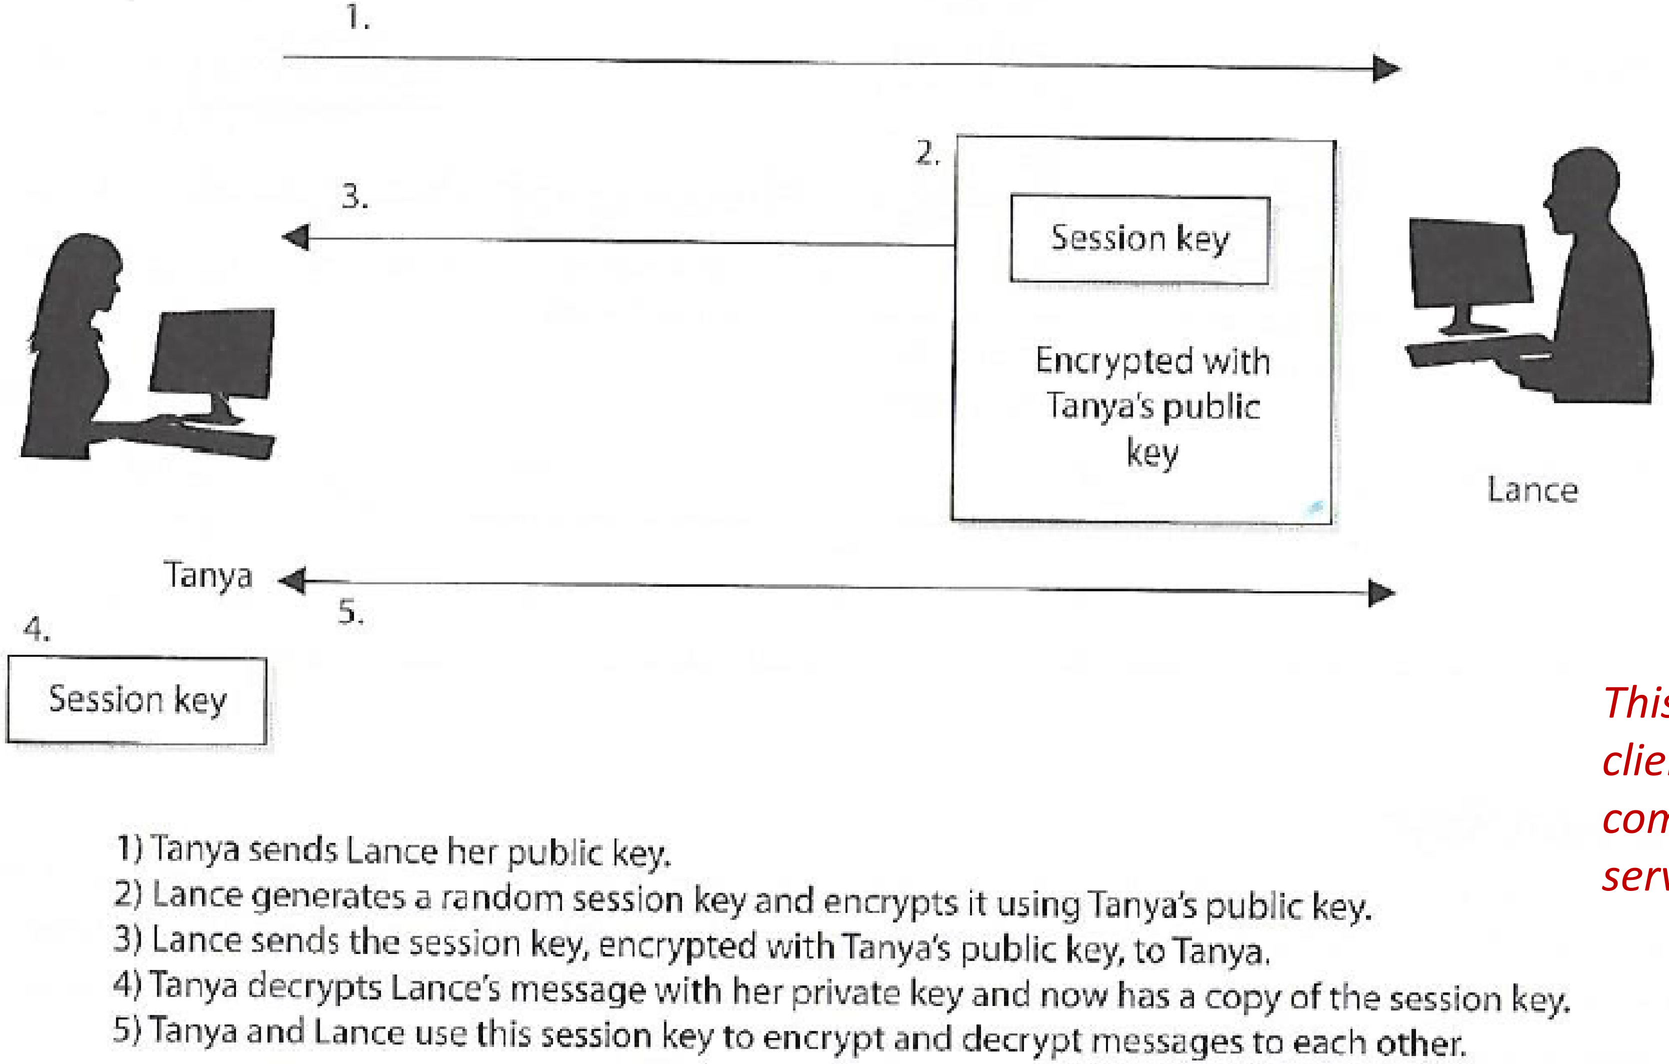
3. Why do we encrypt the message with the symmetric key rather than the asymmetric key?

Quick review

3. Why do we encrypt the message with the symmetric key rather than the asymmetric key?
   - **Because the asymmetric key algorithm is too slow**

Session keys

<u>Single-use</u> symmetric keys used to encrypt messages between two users in an individual communication session



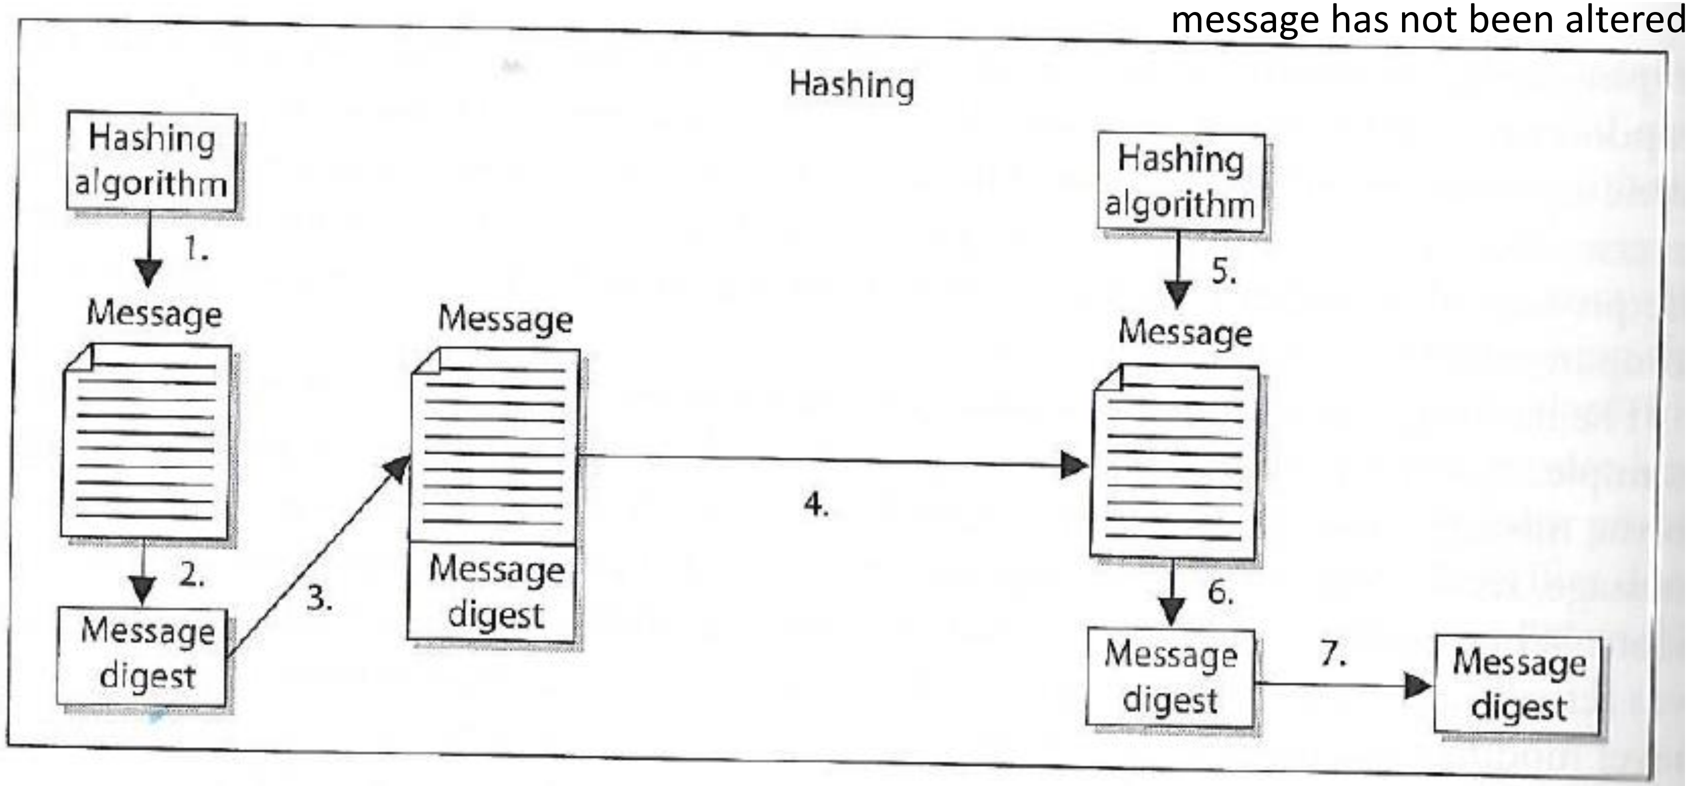
This is how secure web client applications communicate with server-side services

Harris, S. and Maymi, F. (2016) <u>All-In-One CISSP Exam Guide</u>, McGraw Hill Education

One-way Hash

- Assures message **integrity**
- A function that takes a variable-length string (i.e. message) and produces a fixed-length value called a hash value
- Does not use keys

1. Sender puts message through hashing function
2. Message digest generated
3. Message digest appended to the message
4. Sender sends message to receiver
5. Receiver puts message through hashing function
6. Receiver generates message digest value
7. Receiver compares the two message digests values. If they are the same, the message has not been altered



One-way hash example…

Testing the integrity of a file (e.g. program) downloaded from the internet…

PS C:\Users\tue87168> help Get-FileHash

NAME
    Get-FileHash

SYNTAX
    Get-FileHash [-Path] <string[]> [-Algorithm <string> {SHA1 | SHA256 | SHA384 | SHA512 | MACTripleDES | MD5 | RIPEMD160}]
    [<CommonParameters>]

    Get-FileHash -LiteralPath <string[]> [-Algorithm <string> {SHA1 | SHA256 | SHA384 | SHA512 | MACTripleDES | MD5 | RIPEMD160}]
    [<CommonParameters>]

    Get-FileHash -InputStream <Stream> [-Algorithm <string> {SHA1 | SHA256 | SHA384 | SHA512 | MACTripleDES | MD5 | RIPEMD160}]
    [<CommonParameters>]

ALIASES
    None

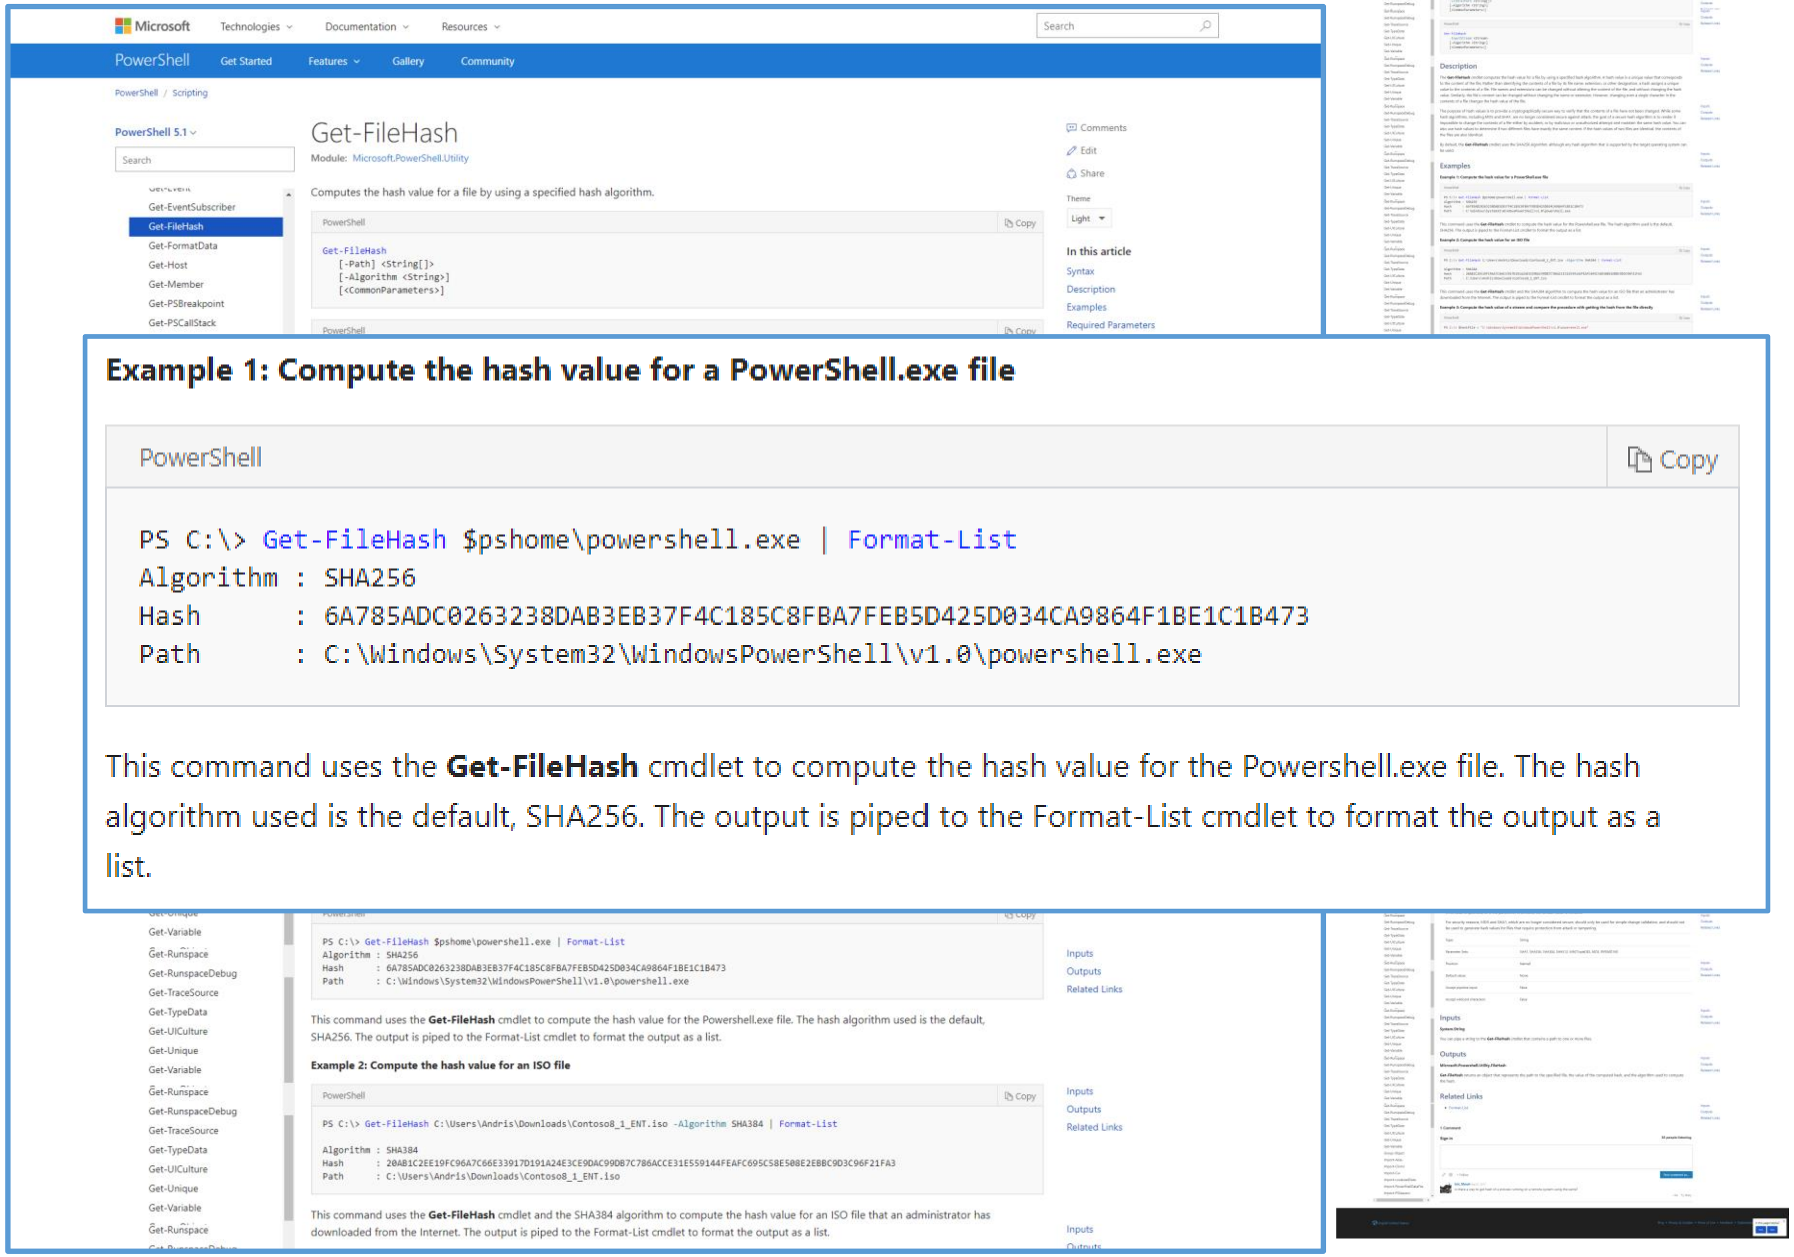
REMARKS
    Get-Help cannot find the Help files for this cmdlet on this computer. It is displaying only partial help.
        -- To download and install Help files for the module that includes this cmdlet, use Update-Help.
        -- To view the Help topic for this cmdlet online, type: "Get-Help Get-FileHash -Online" or
           go to http://go.microsoft.com/fwlink/?LinkId=517145.

PS C:\Users\tue87168>
```

PowerShell

One-way hash example…

https://docs.microsoft.com/en-us/powershell/module/microsoft.powershell.utility/get-filehash?view=powershell-5.1



Example 1: Compute the hash value for a PowerShell.exe file

PowerShell

```
PS C:\> Get-FileHash $pshome\powershell.exe | Format-List
Algorithm : SHA256
Hash      : 6A785ADC0263238DAB3EB37F4C185C8FBA7FEB5D425D034CA9864F1BE1C1B473
Path      : C:\Windows\System32\WindowsPowerShell\v1.0\powershell.exe
```

This command uses the **Get-FileHash** cmdlet to compute the hash value for the Powershell.exe file. The hash algorithm used is the default, SHA256. The output is piped to the Format-List cmdlet to format the output as a list.

Windows PowerShell

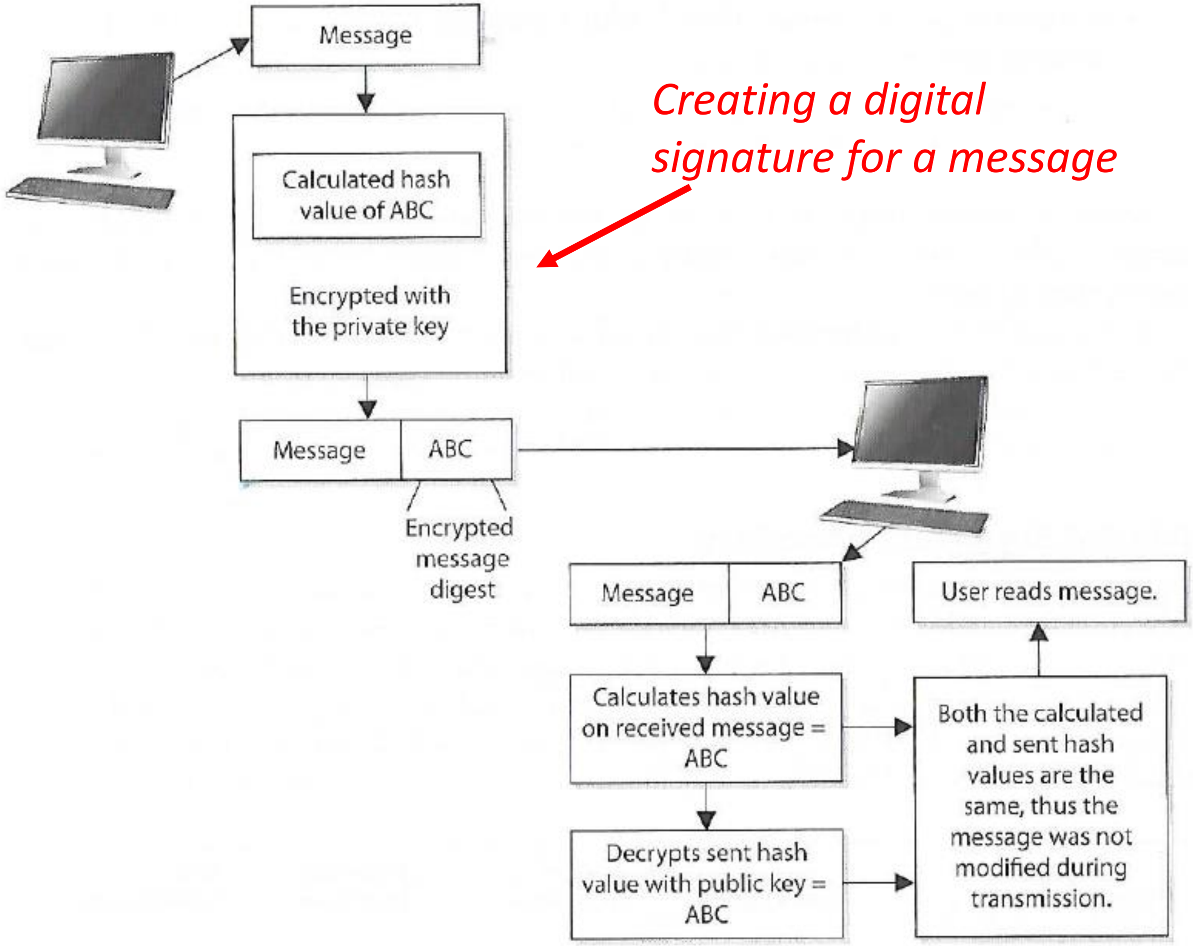
Digital Signature

- A hash value encrypted with the sender's private key
- The act of signing means encrypting the message's hash value with the private key



Creating a digital signature for a message

Harris, S. and Maymi, F. (2016) All-In-One CISSP Exam Guide, McGraw Hill Education

Summary: Symmetric Algorithms

Name	Key Length (bits)	Block Size (bits)	Notes
DES	56 (56 + 8 parity)	64	Replaced by 3DES
3DES	56, 112, or 168 (+ 8, 16, 24 parity)	64	Replaced by AES
Blowfish	32 to 448	64	Replaced by Twofish
TwoFish	128, 192, or 256	128	Slower than AES.
AES (Rijandel)	128, 192, or 256	128	FIPS 197
RC4	8 to 2048-bit key (usually 40 to 256)	Stream	No longer in use
RC5	Variable (up to 2048)	32, 64, or 128	Very Strong
RC6	128, 192, and 256 bits up to 2040-bits	128	Based on RC5. (RSA)

Summary: Asymmetric Algorithms *(primarily used for key transport/exchange)*

- RSA – is the Public Key Cryptography Standard #1 (PKCS)
- Diffie-Hellman
- El Gamal
- Elliptic Curve Cryptography
  - ECDH
  - ECDSA

Summary: Hashing Algorithms (Integrity)

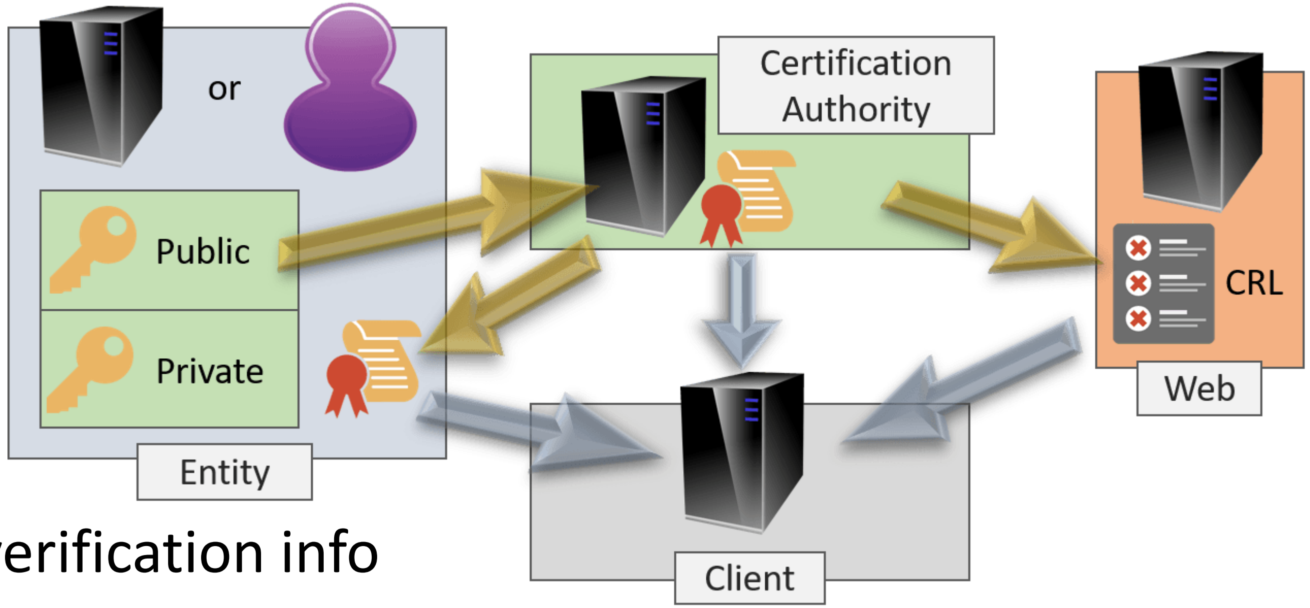
	Hash Size (bits)	Block Size (bits)	Rounds	Strength
MD5	128	512	64	Weak – Password Files
SHA-0	160	512	80	Weak
SHA-1	160	512	80	Generally not recommended for Federal Systems – Refer to NIST SP800-131A for allowable uses.
SHA-2 (224 or 256)	224 or 256	512	64	Acceptable, 256 recommended
SHA-2 (384 or 512)	384 or 512	1024	80	All of the following are acceptable. Refer to NIST SP800-57 Part 1
SHA-512/224	224	1024	80	
SHA-512/256	256	1024	80	
SHA3-224	224	1600	1152	
SHA3-256	256	1600	1088	
SHA3-384	384	1600	832	
SHA3-512	512	1600	576	

https://csrc.nist.gov/Projects/Hash-Functions/NIST-Policy-on-Hash-Functions

Reasons to Use Cryptography

Reason	How achieved
Confidentiality	The message can be encrypted
Integrity	The message can be hashed and/or digitally signed
Authentication	The message can be digitally signed
Nonrepudiation	The message can be digitally signed

PKI Components



Digital Certificates

- Contains Public Key identity and verification info

Certificate Authorities (CA)

- Trusted entities that issues certificates

Registration Authorities (RA)

- Verify identity for certificate requests

Certificate Revocation List (CRL)

- A list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted

Examples of Cryptanalysis Attacks

- Brute force
  - Trying all key values in the keyspace
- Frequency Analysis
  - Guess values based on linguistic analysis of frequency of occurrence of letters
- Dictionary Attack
  - Find plaintext based on common words
- Replay Attack
  - Repeating previous known values
- Known Plaintext
  - Format or content of plaintext available

Quiz

1. The review of router access control lists should be conducted during:
    a. An environmental review
    b. A network security review
    c. A business continuity review
    d. A data integrity review

1. The review of router access control lists should be conducted during:
    a. An environmental review
    b. A network security review
    c. A business continuity review
    d. A data integrity review

Quiz

2. During an audit of a telecommunication system, an IS auditor finds that the risk of intercepting data transmitted to and from remote sites is very high. The MOST effective control for reducing this exposure is:
    a. Encryption
    b. Callback modems
    c. Message authentication
    d. Dedicated Leased lines

2. During an audit of a telecommunication system, an IS auditor finds that the risk of intercepting data transmitted to and from remote sites is very high. The MOST effective control for reducing this exposure is:
    a. Encryption
    b. Callback modems
    c. Message authentication
    d. Dedicated Leased lines

Quiz

3. A digital signature contains a message digest to:
    a. Show if the message has been altered after transmission
    b. Define the encryption algorithm
    c. Confirm the identity of the originator
    d. Enable message transmission in a digital format

3. A digital signature contains a message digest to:
    a. Show if the message has been altered after transmission
    b. Define the encryption algorithm
    c. Confirm the identity of the originator
    d. Enable message transmission in a digital format

Quiz

4. Digital signatures require the:
   a. Signer to have a public key and the receiver to have a private key
   b. Signer to have a private key and the received to have a public key
   c. Signer and receiver to have a public key
   d. Signer and receiver to have a private key

4. Digital signatures require the:
   a. Signer to have a public key and the receiver to have a private key
   b. Signer to have a private key and the received to have a public key
   c. Signer and receiver to have a public key
   d. Signer and receiver to have a private key

Quiz

5. When using public key encryption to ensure confidentiality of data being transmitted across a network:
   a. Both the key used to encrypt and decrypt the data are public
   b. The key used to encrypt is private, but the key used to decrypt the data is public
   c. The key used to encrypt is public, but the key used to decrypt the data is private
   d. Both the key used to encrypt and decrypt the data are private

5. When using public key encryption to ensure confidentiality of data being transmitted across a network:
   a. Both the key used to encrypt and decrypt the data are public
   b. The key used to encrypt is private, but the key used to decrypt the data is public
   c. The key used to encrypt is public, but the key used to decrypt the data is private
   d. Both the key used to encrypt and decrypt the data are private

Quiz

6. During an audit of an enterprise that is dedicated to e-commerce, the IS manager states that digital signatures are used when receiving communications from customers. To substantiate this, an IS auditor must prove that which of the following is used?
   a. A biometric, digitized and encrypted parameter with the customer's public key
   b. A hash of the data that is transmitted and encrypted with the customer's private key
   c. A hash of the data that is transmitted and encrypted with the customer's public key
   d. The customer's scanned signature encrypted with the customer's public key

6. During an audit of an enterprise that is dedicated to e-commerce, the IS manager states that digital signatures are used when receiving communications from customers. To substantiate this, an IS auditor must prove that which of the following is used?
   a. A biometric, digitized and encrypted parameter with the customer's public key
   b. A hash of the data that is transmitted and encrypted with the customer's private key
   c. A hash of the data that is transmitted and encrypted with the customer's public key
   d. The customer's scanned signature encrypted with the customer's public key

Quiz

7. Email message authenticity and confidentiality is BEST achieved by signing the message using the:
    a. Sender's private key and encrypting the message using the receiver's public key
    b. Sender's public key and encrypting the message using the receiver's private key
    c. Receiver's private key and encrypting the message using the sender's public key
    d. Receiver's public key and encrypting the message using the sender's private key

7. Email message authenticity and confidentiality is BEST achieved by signing the message using the:
    a. Sender's private key and encrypting the message using the receiver's public key
    b. Sender's public key and encrypting the message using the receiver's private key
    c. Receiver's private key and encrypting the message using the sender's public key
    d. Receiver's public key and encrypting the message using the sender's private key

Quiz

8. Which of the following effectively verify the originator of a transaction?
   a. Using a secret password between the originator and the receiver
   b. Encrypting the transaction with the receiver's public key
   c. Using a portable document format (PDF) to encapsulate transaction content
   d. Digitally signing the transaction with the source's private key

8. Which of the following effectively verify the originator of a transaction?
   a. Using a secret password between the originator and the receiver
   b. Encrypting the transaction with the receiver's public key
   c. Using a portable document format (PDF) to encapsulate transaction content
   d. Digitally signing the transaction with the source's private key

Quiz

9. Which of the following is the MOST effective type of antivirus software to detect an infected application?
   a. Scanners
   b. Active monitors
   c. Hash-based integrity checkers
   d. Vaccines

9. Which of the following is the MOST effective type of antivirus software to detect an infected application?
   a. Scanners
   b. Active monitors
   c. Hash-based integrity checkers
   d. Vaccines
